ILLINOIS SUSTAINABLE  
TECHNOLOGY CENTER  
PRAIRIE RESEARCH INSTITUTE

# Algae has attracted significant investment

- Exxon-Mobil committed up to \$600 Million for algal biofuel research in 2009

- Algal companies attracting significant venture capital- Sapphire, Algenol, Aurora, Heliae

- Algal biofuel trials by the Navy, United Continental, and Virgin Atlantic Airlines

- UAL signed a letter of intent to purchase 20 Mgal/yr of renewable algal bio fuels in 2014

- AlgaeWheel wastewater system receives the Water Environment Federation's Innovative Technology Award in 2015

# Why all the interest in Algae?

## Life and the Evolution of Earth's Atmosphere

James F. Kasting<sup>1,2</sup> and Janet L. Siefert<sup>2</sup>

(Science, 2002)

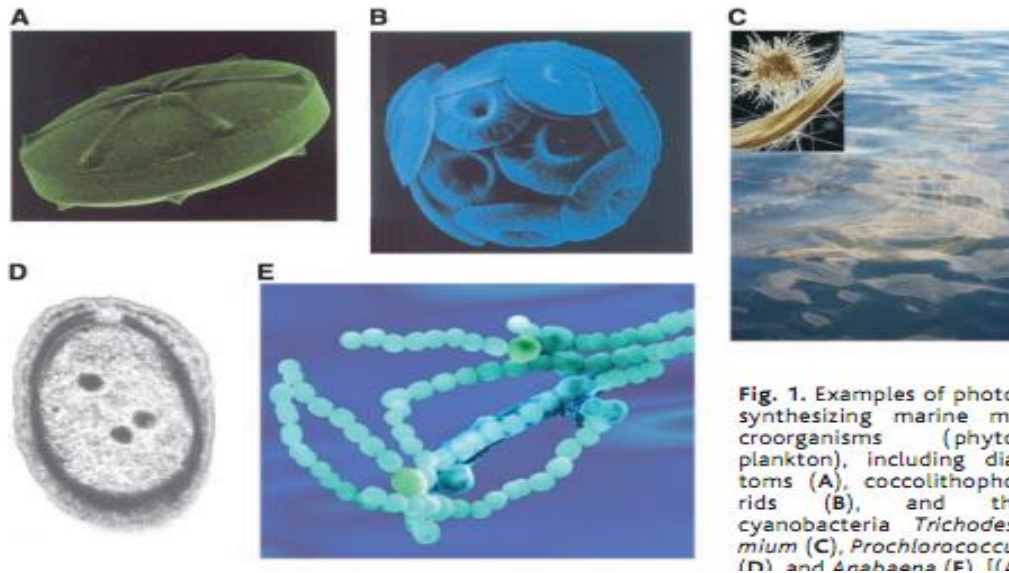

Fig. 2. This photograph of Saturn's moon Titan, shows the orange-tinted haze that is thought to be formed by photolysis of methane and charged-particle bombardment of the upper atmosphere. The Cassini mission, now on its way to Saturn, will test this model by dropping a probe into Titan's atmosphere.

- Algae has had transformative effects on the earth!
- Can we tap the power of algae to transform our world again into a more sustainable paradigm for the environment, energy and economy?

# Algae Can Provide Significant Nutritional Products

- Ancient Chinese and Aztec cultures record algal food uses
- Algae provide ~ 50% of global primary production
- Global algae production > 7000 tons/yr and \$1-2 Billion/yr
- Many algae are rich in protein and amino acids (>60%)
  - Peptides extracted from *Chlorella* can prevent cellular damage (*Lordan et al, 2011*)
- Many algae are rich in natural pigments and antioxidants
  - Astaxanthin- red pigment in krill oil and pink color in salmon
  - Phycocyanin- highly desired natural blue pigment
- Many algae are a rich source of Omega 3 poly-unsaturated fatty acids (PUFAs)

# Algae for $\Omega$ -3/6 poly-unsaturated fatty acids (PUFA)

- Docosahexaenoic Acid (DHA, 22:6n3)
- Eicosapentaenoic Acid (EPA, 20:5n3)
- Arachidonic Acid (AA, 20:4n6)
- Reduces cardiovascular diseases & obesity (Breslow, 2006)
- Key roles in cellular and tissue metabolism (Cardozo 2007, Guaratini et al. 2007)
  - Regulation of membrane fluidity
  - Thermal adaptation
  - Electron and oxygen transport

# Algae PUFA Content and Market Value

	<b>EPA</b>	<b>DHA</b>
<b>Cod Liver Oil</b>	12.5% TFA	9.9% TFA
<b><i>Isochrysis galbana</i></b>	22.6%	8.4%
<b><i>Phaeodactylum tricornutum</i></b>	29.9%	0.2%
<b><i>Pavlova sp.</i></b>	18.0%	13.2%
<b>Market Value</b>	\$200,000/ton	\$18,000,000/ton

# Algae can be an advantageous animal feed product

- Omega 3/6 PUFA enriched meat & egg products
- Adding algae to the diet of cows resulted in
  - Lower breakdown of unsaturated fatty acids
  - Better weight control, healthier skin and a lustrous coat (Pulz and Gross 2004)
- Improved the color of the skin, shanks and egg yolks of poultry

# Algae can be used for Cosmetics and other Chemical Products

- Spolaore et al. (2006) noted that algae can
  - Repair signs of early skin aging,
  - Exert skin-tightening effect
  - Prevent stria formation
  - Stimulate collagen synthesis in skin

- Algae has applications for
  - anti-aging cream
  - emollient
  - anti-irritant in peelers
  - sun protection
- Algae has been used in a variety of chemical products
  - plastics, fertilizers, soil conditioners, etc

# Algae can provide significant biofuels:

*High productivity & oil content*

Crop and Fuel	Fuel Yield (gal/acre)
Soy Biodiesel	45 - 60
Canola Biodiesel	100 - 130
<b>Algae Biodiesel</b> (15% oil, 10 g/m <sup>2</sup> /d) (50% oil, 50 g/m <sup>2</sup> /d)	<b>600 - 10,000</b>
Corn Ethanol	300 - 600
Miscanthus Eth.	800 - 1,200

Source: Chisti, 2009

## Long-term Field Studies

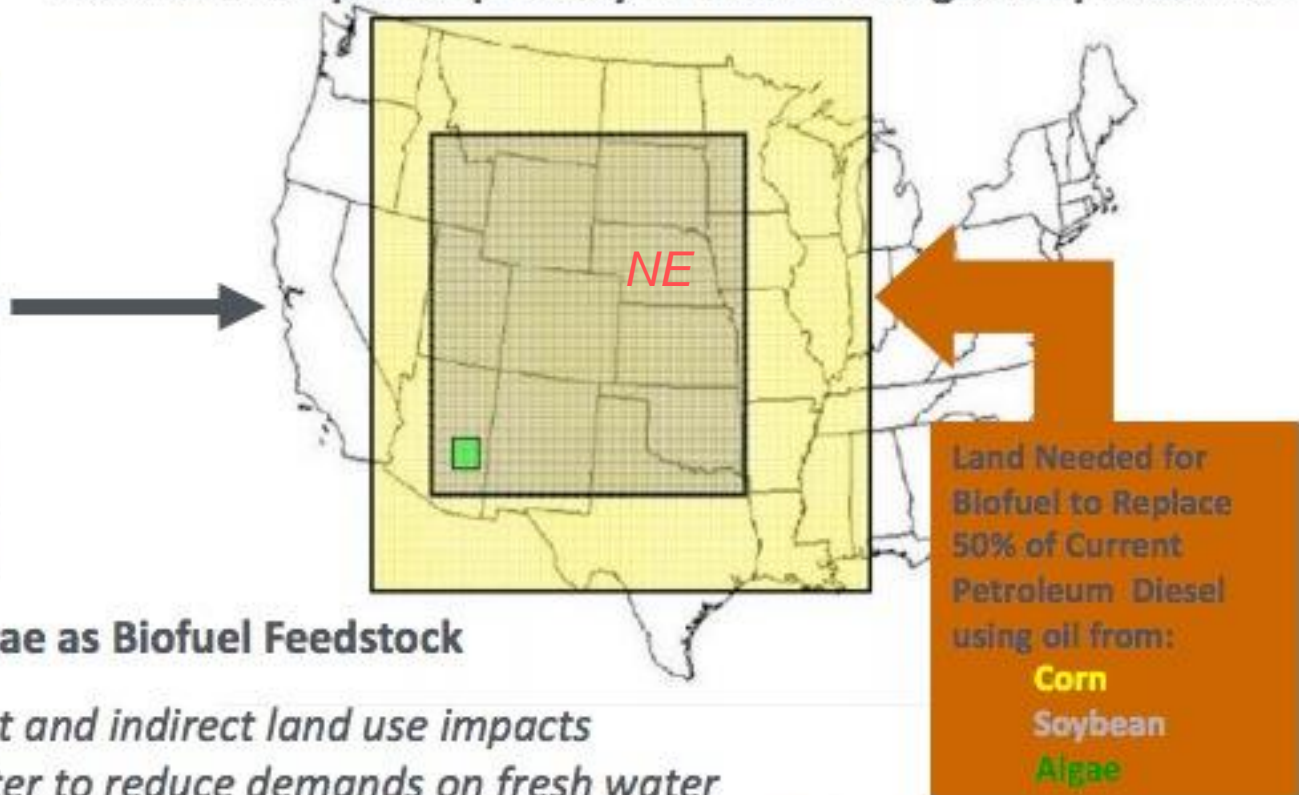

- 10 g/m<sup>2</sup>/day, Wiessman, 1988, 730 days, 1000 m<sup>2</sup>, New Mexico
- 30 g/m<sup>2</sup>/day, Laws, 1985, 400 days, 48 m<sup>2</sup>, Hawaii,
- 20 g/m<sup>2</sup>/day, Seambiotic, 650 m<sup>2</sup>, Israel
- 40 g/m<sup>2</sup>/day, AlgaeLink, Netherlands, (bioreactor)

# The Potential Advantages of Algae

Gallons of Oil per Acre per Year (approximate)	
Corn	18
Soybeans	48
Safflower	83
Sunflower	102
Rapeseed	127
Oil Palm	635
Micro Algae	700 - 7000

## Notional example for photosynthetic microalgae oil production

## Key Attributes of MicroAlgae as Biofuel Feedstock

- *Reduced land footprint and indirect land use impacts*
- *Can use non-fresh water to reduce demands on fresh water*
- *High production potential for both whole biomass and neutral lipids*
- *Potential source of high quality feedstock for advanced biofuels production*
- *Need not compete with agricultural lands and water for food/feed production*
- *Can potentially recycle CO<sub>2</sub>, organic carbon, & nutrients from waste streams*

**However, affordable and productive commercial scale operations not yet demonstrated**

# Algae Can Provide Carbon Capture: *Synergy with power plant CO<sub>2</sub> mitigation*

- ③ Total US CO<sub>2</sub> emissions = 6.6 billion tons CO<sub>2</sub> / yr
- ③ US power industry CO<sub>2</sub> = 2.5 billion tons CO<sub>2</sub> / yr
- ③ 100% US diesel via algae ~ 1 - 4 billion tons CO<sub>2</sub>/yr
- ③ Algae bioreactors can utilize 30% - 90% of injected CO<sub>2</sub>
- ③ Algae growth and power usage both follow a diurnal pattern

# Algae Can Treat Wastewater:

## *Shared facilities & reuse of water/nutrients*

*(Photos courtesy of Hydromentia, Inc.)*

- ◎ 100% US diesel demand via algae would use 0.3 - 40 Billion gpd
  - ◎ US fresh water withdrawal = 346 Bgpd
  - ◎ US municipal wastewater = 40 Bgpd
- ◎ Algal wastewater treatment provides superior nutrient removal to avoid downstream water quality problems
- ◎ National Algal Biofuels Technology Roadmap (DOE, 2010)
  - ◎ *“Inevitably, wastewater treatment and recycling must be incorporated with algae biofuel production...”*

# Impacts of Residual Wastewater Nutrients

- ③ N and P removal at WWTPs is costly: \$8,130 and \$49,500 per ton (*Hey et al., 2006*)
- ③ Most conventional nutrient removal processes do not beneficially reuse nutrients
- ③ Opportunity for added value from algae cultiv.
- ③ Environmental algae grow on residual nutrients & cause downstream problems
  - ③ Eutrophication
  - ③ Algal toxins
  - ③ Hypoxia

# Current Demonstration Project @ UIUC Swine Research Center

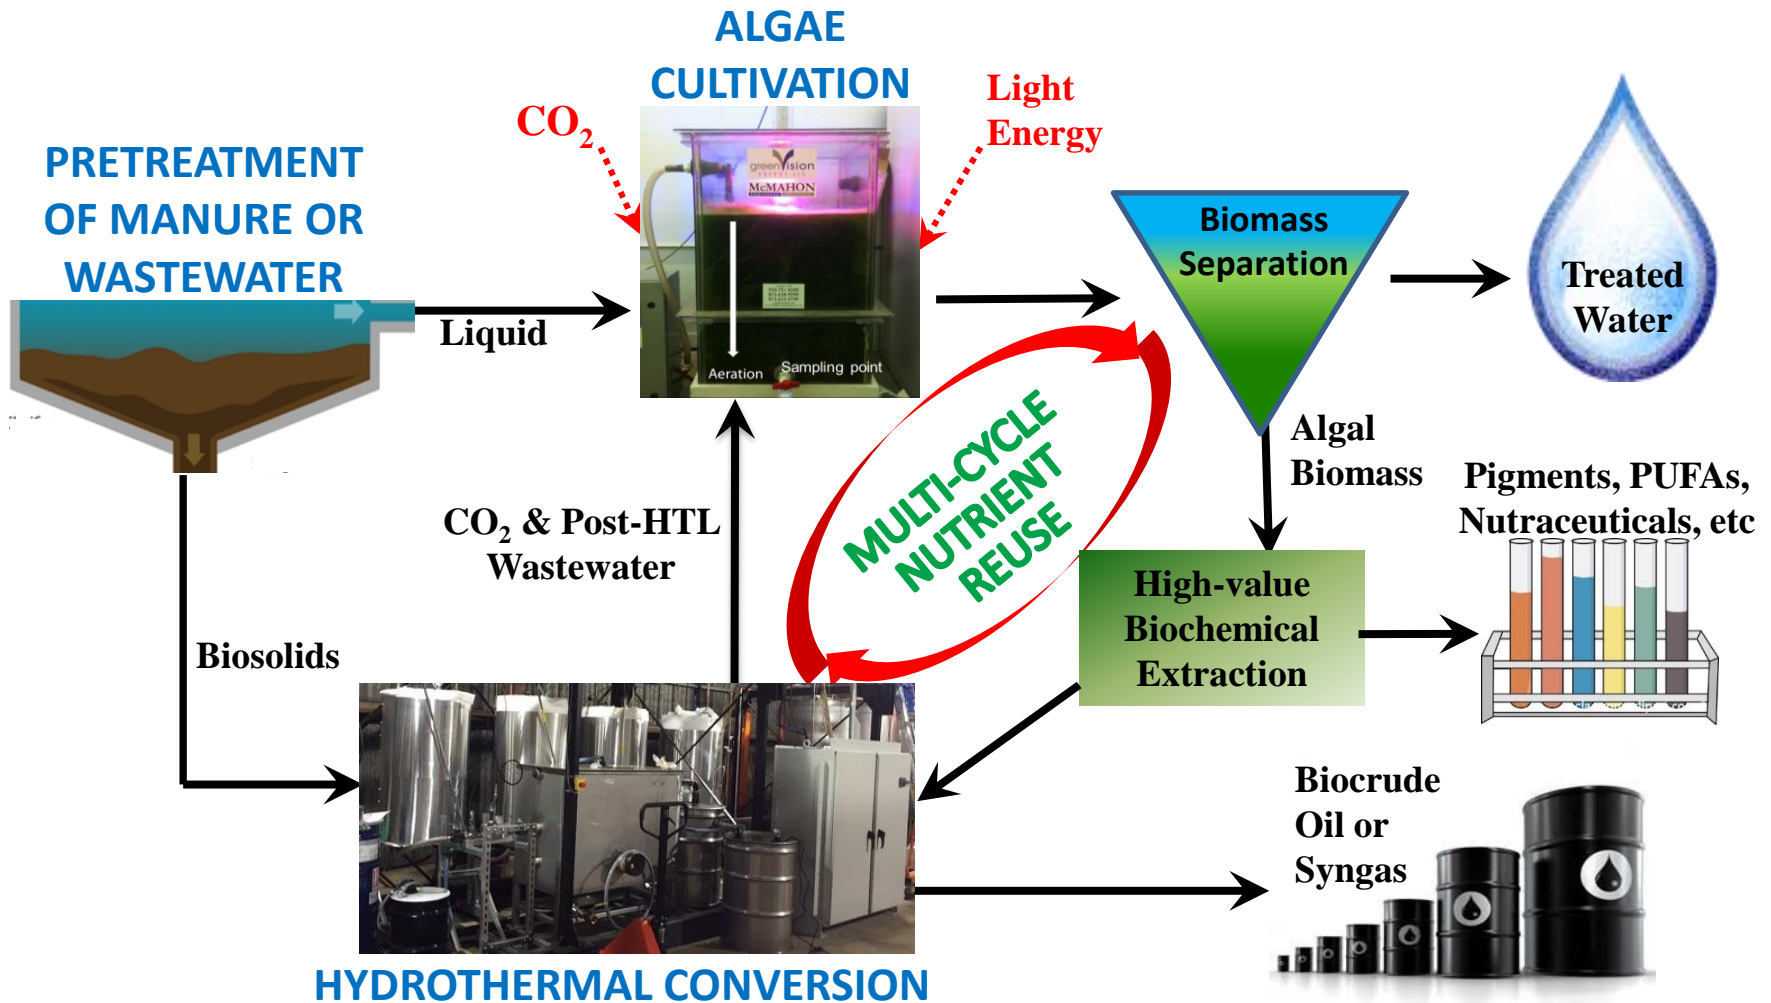

# How Much do Algal Biofuels Cost?

	2015 SOT	2022 Projection	AOU	AHTL- Algaewheel	Ads- Algaewheel
Feedstock (Cost per gallon oil produced \$/gal-oil)	\$11.3	\$3.2	\$7.0	\$7.8	\$6.8
Conversion	\$1.2	\$0.5	\$4.2	\$2.1	\$1.9
Upgrade to Finished Fuels	\$0.4	\$0.3	\$0.3	\$0.4	\$0.4
CHG	\$1.5	\$0.6		\$1.5	
Balance of Plant	\$0.3	\$0.2			
<b>Total Cost before Byproduct Credit (\$/ gal)</b>	<b>\$14.8</b>	<b>\$4.7</b>	<b>\$11.4</b>	<b>\$11.9</b>	<b>\$9.2</b>
Byproduct Credit					
WW Treatment Credit (BOD removal) (\$/gal oil produced)			\$9.0	\$43.1	\$36.9
Electricity Credit (\$/gal oil produced)			\$1.5	\$0.3	
<b>Minimum Selling Price (\$/gallon oil)</b>	<b>\$14.8</b>	<b>\$4.7</b>	<b>\$0.91</b>	<b>-\$31.5</b>	<b>-\$27.7</b>

- Wastewater Treatment Credits are highly advantageous for economic viability of algal biofuels

# Combining Algae Cultivation with Wastewater Treatment Can Amplify Algal Biofuels Production

# Why Hydrothermal Conversion (HTL/G)?

*It converts wet, low-lipid biomass into crude oil or gas*

**HTL has a positive net energy balance**

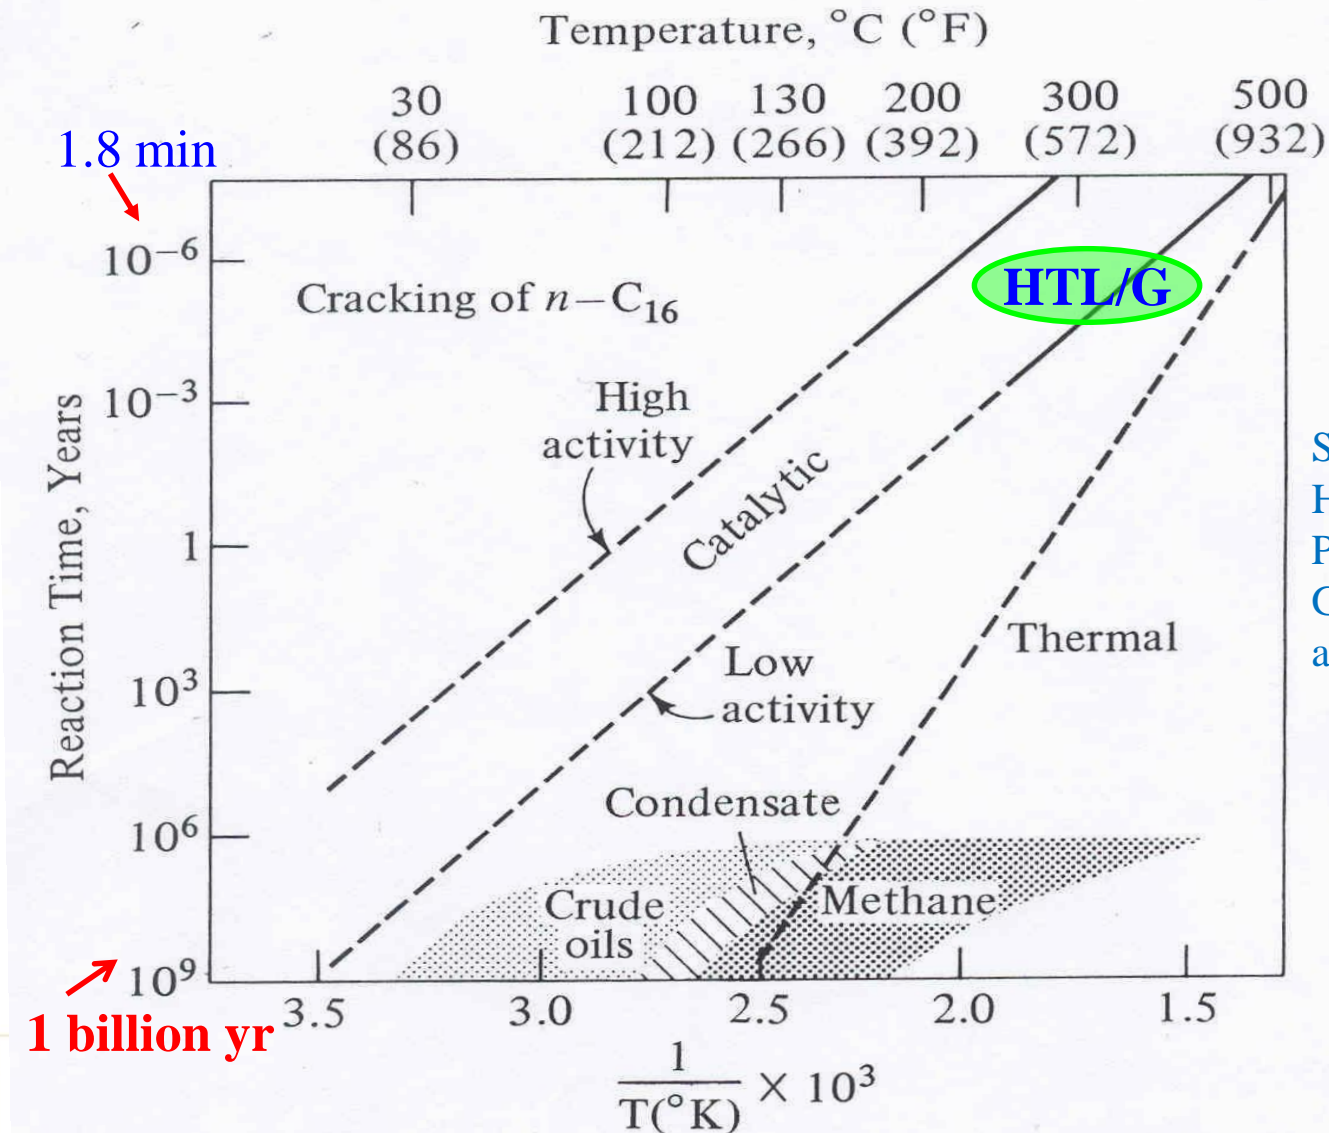

**E<sub>out</sub> : E<sub>in</sub> > 3:1 at lab-scale (% solids =20%)**

**E<sub>out</sub> : E<sub>in</sub> > 10:1 w/ heat exchangers**

**Oil characterization: Vardon et al. 2011, Bioresource Tech.**

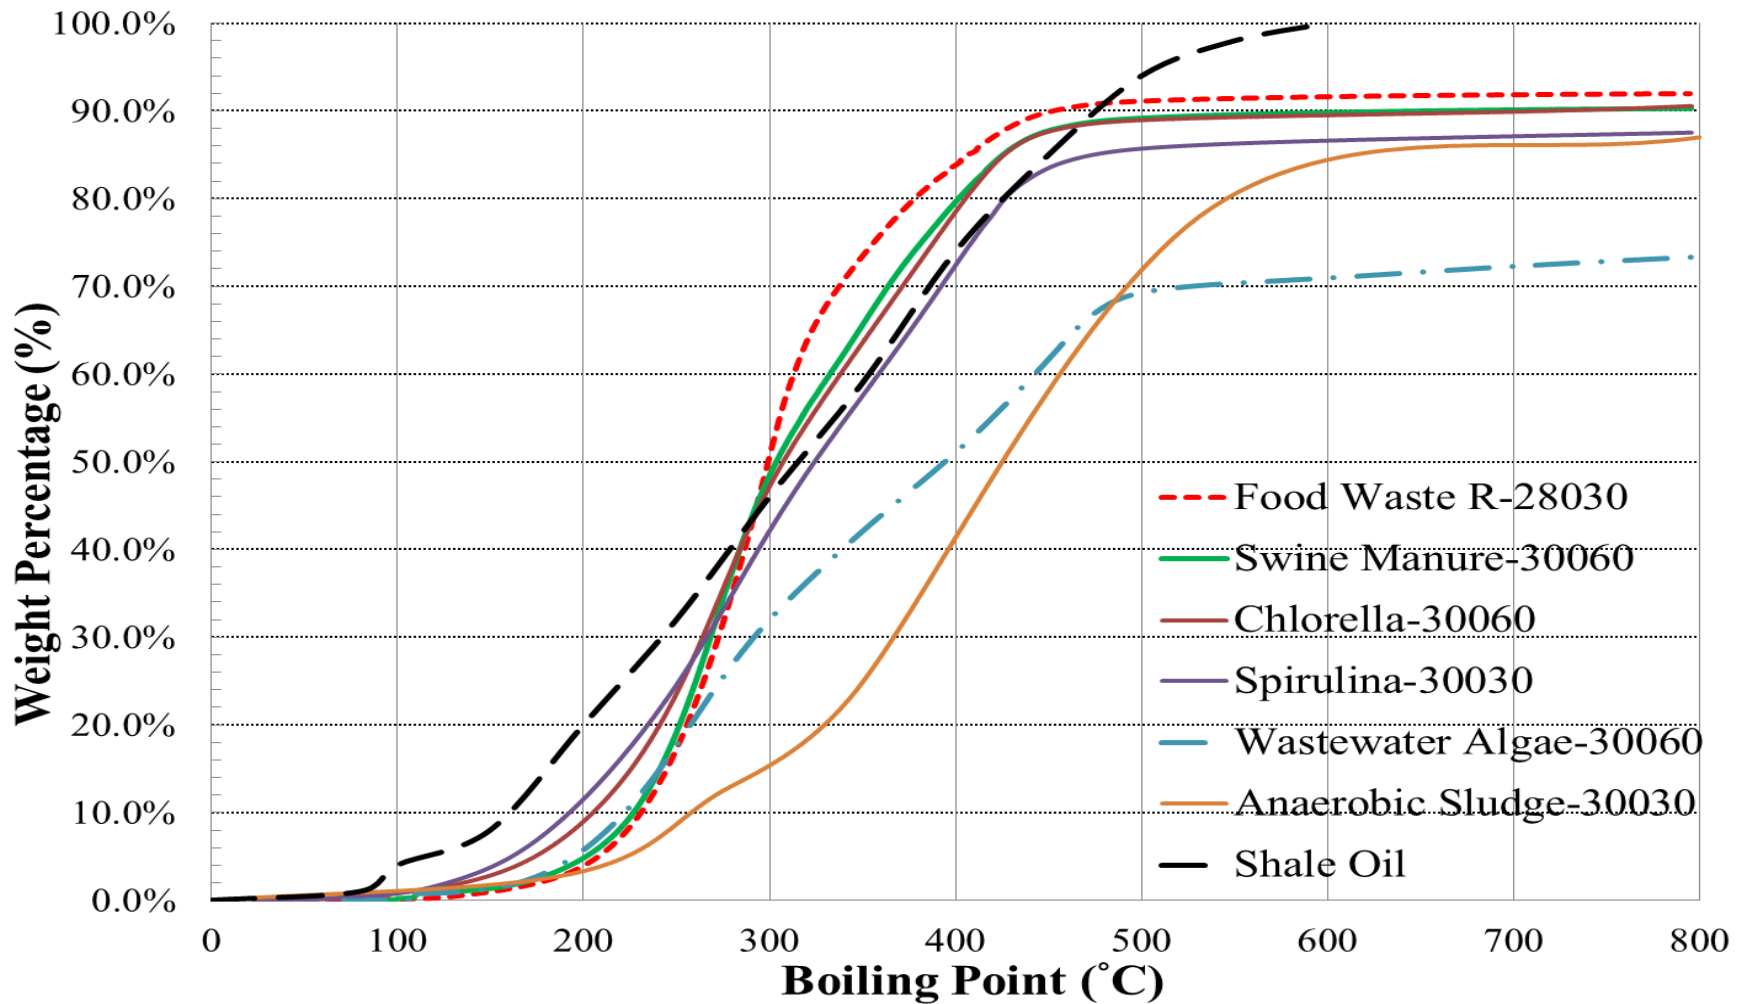

# Hydrothermal processes mimic natural fossil fuel production ... but accelerate it tremendously

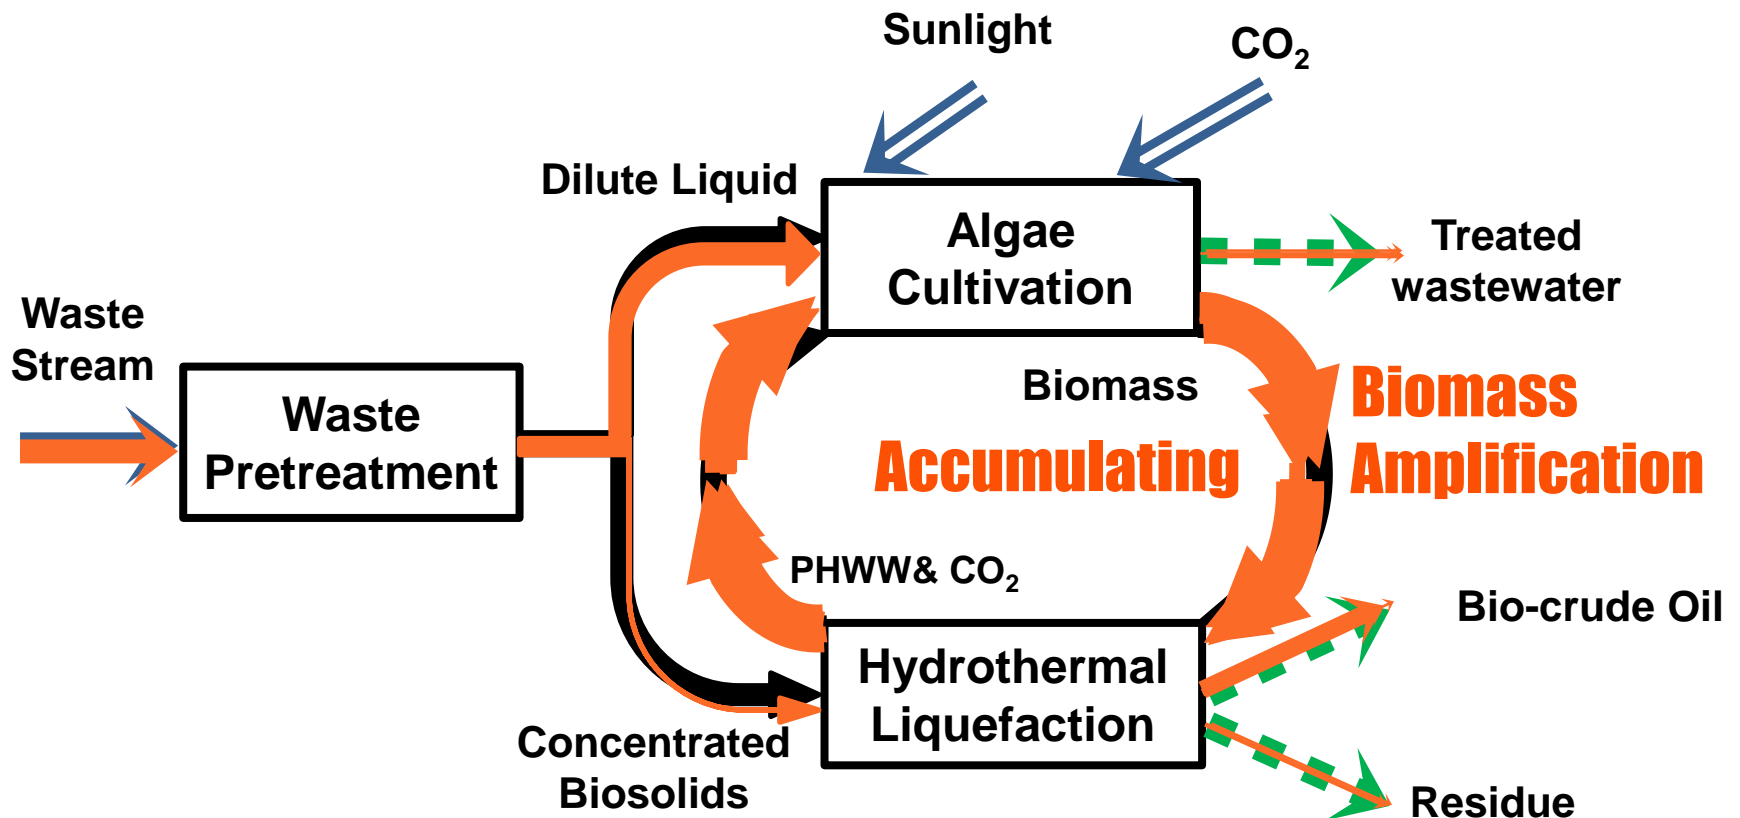

Source:  
Hunt, J. (1996)  
Petroleum  
Geochemistry  
and Geology

# HTL Bio-oil Distillation is Similar to Shale Oil

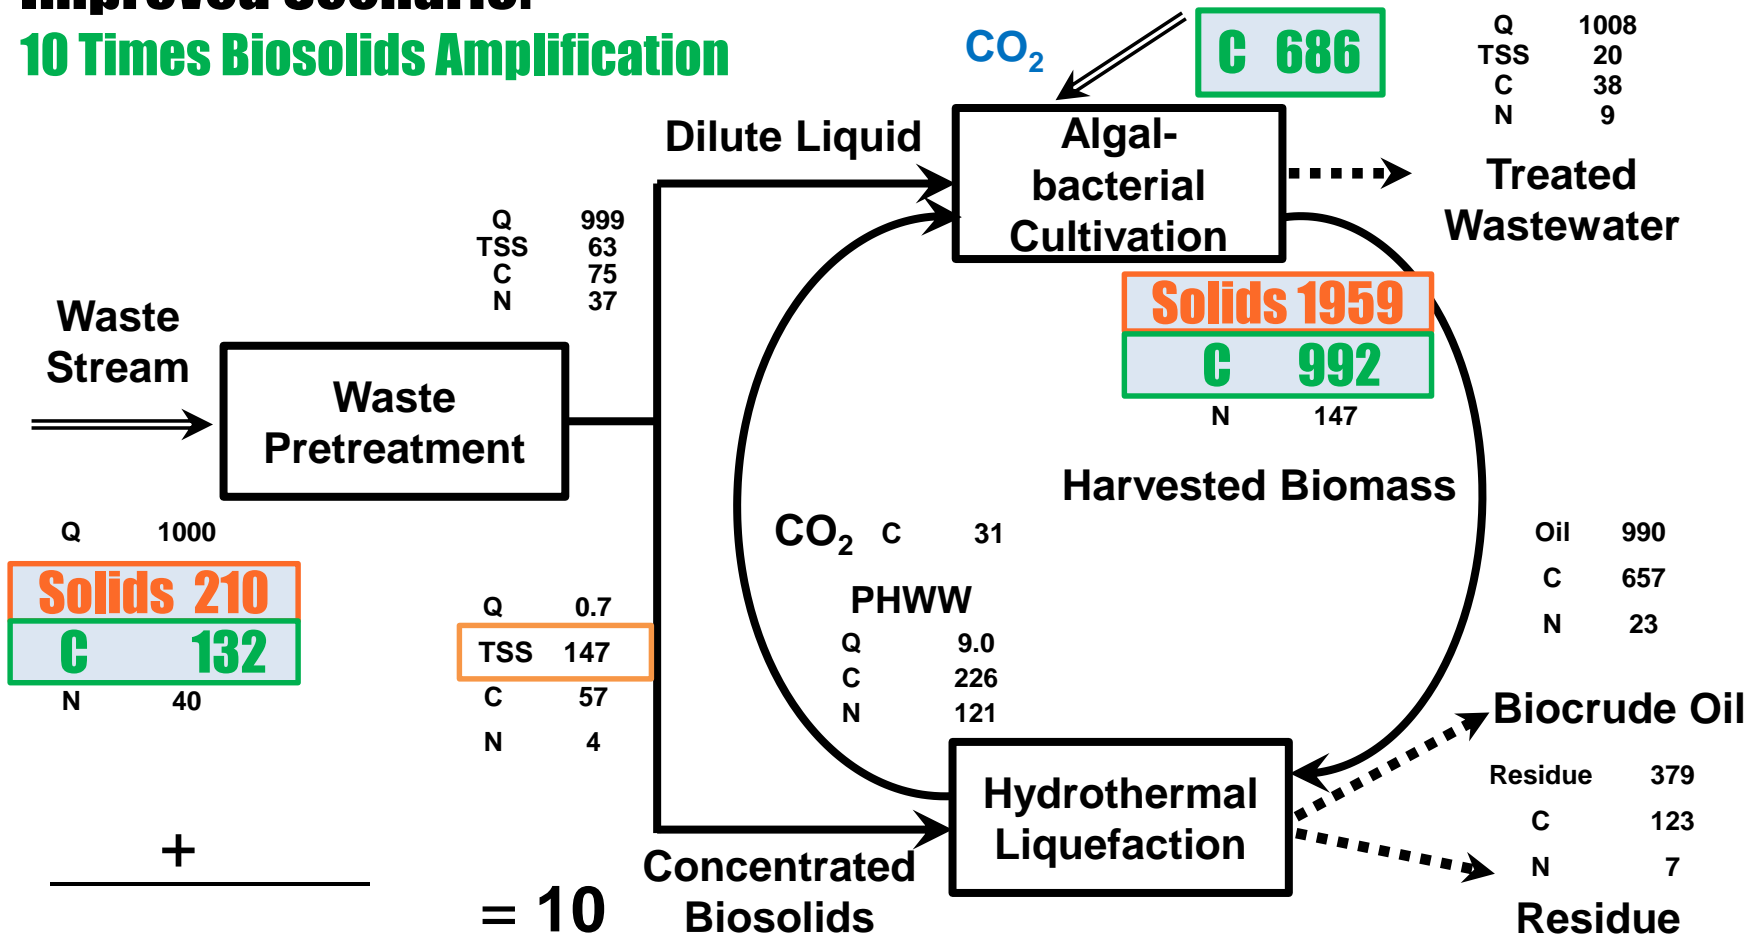

# STELLA Modelling of Nutrient Cycling Impacts in the Environment-Enhancing Energy (E2-Energy) System (Zhou et. al, EES, 2013)

# Modelling Results and Discussion

## Improved Scenario:

### 10 Times Biosolids Amplification

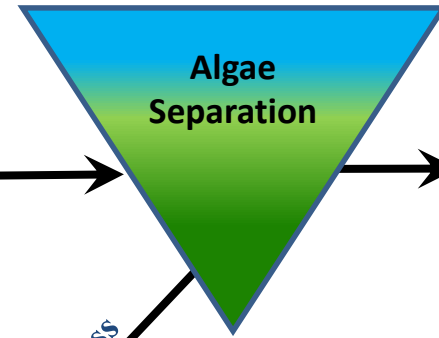

# E<sup>2</sup>-Energy Example for Champaign-Urbana

120,000 people  
**20 Dry Tons/d Biosolids**

Fast-growing algae,  
3-5% solar energy efficiency

**60-200 Dry  
Tons Biomass**

post- HTL  
ww with  
nutrients

CO<sub>2</sub>

Algal Biomass

Concentrated  
solid

**150-800 Barrels Oil per day**

HTL conversion of  
biosolids & algae

# Let's Think Big ... The E<sup>2</sup>-Energy Potential

US Wastewaters CONTAIN:  
- 54 Billion m<sup>3</sup> of water  
- 0.2 Billion dry tons of nutrient-rich biosolids

We can GROW 0.6-2.0 billion dry tons of mixed algal biomass

We can CONVERT WW algae into 0.3-1.2 billion tons of bio-crude oil

\* The US currently consumes ~1.1 billion tons of crude oil.  
\* Corn ethanol production is 0.06 billion tons of biofuel.

# Next Steps: SUNRAES- New Algal Wastewater Project with Metropolitan Water Reclamation District (MWRD)

- Scalable **Urban Nutrient Removal** via **Algae Extraction from Sewage**
- Rapid nutrient removal is the key goal
  - Reduce retention time from 48 hr to 8 hr
  - Illinois proposing effluent P < 1.0 mg/L
- Algae (lighted reactor) can provide improved removal of phosphorus (TSP) and nitrogen (TSN) in comparison to activated sludge process (dark control)
- Algae can also provide enhanced removal of emerging contaminants
  - Endocrine Disruptors, Pharmaceuticals

# Next steps: POWIR-UhP DOE Proposal (\$40-\$50 Mil)

## Design/Build of Large HTL System for Wastewater Biosolids

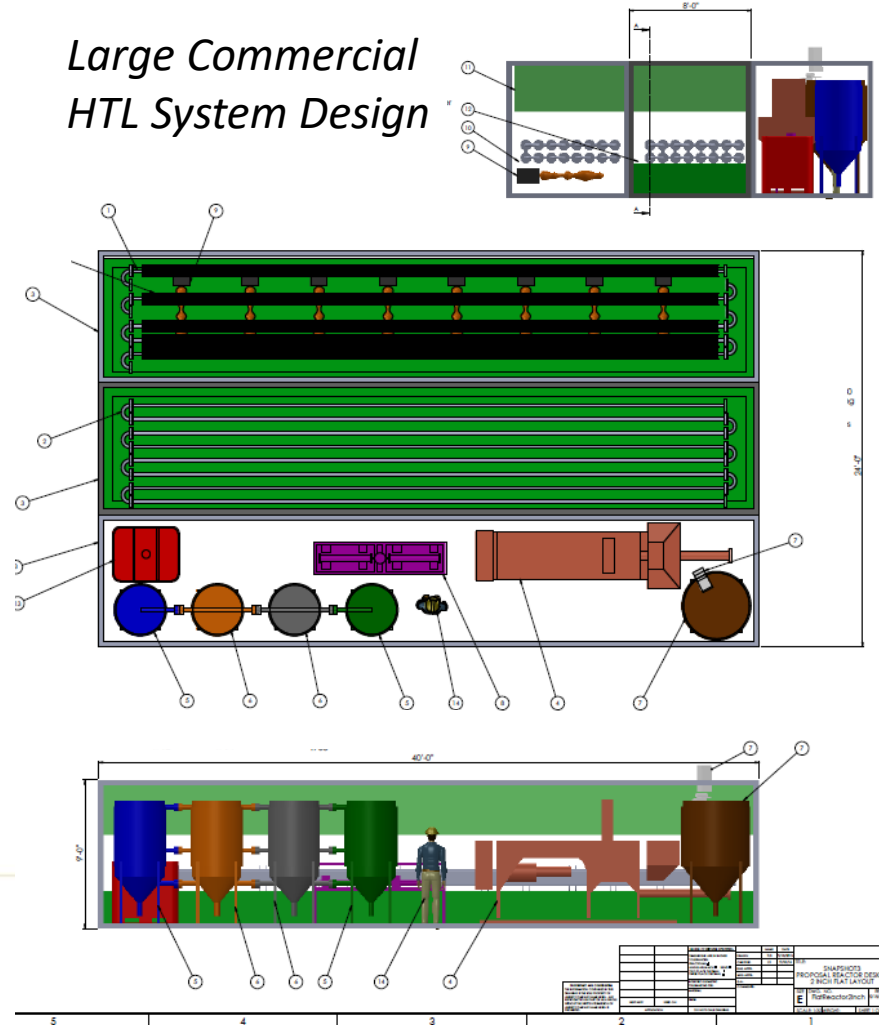

*10 wet ton/day Demonstration HTL System on UIUC South Farms*

*Small Commercial HTL System*

*Large Commercial HTL System Design*

# Summary and Conclusions

- Algae can be advantageous for a wide variety of uses and services
  - Nutritional products for humans or animals
  - Biofuels and other biochemicals
  - Wastewater treatment and carbon capture
- Lower value commodity products like biofuels made from algal biomass need a co-product or subsidy for economic viability
- Integration of wastewater treatment with algae cultivation and hydrothermal liquefaction provides synergistic benefits and lower costs
  - Enhanced removal of nutrients and bioactive compounds
  - Dual-use infrastructure facilitates cost effective algal biomass production
  - Potential to amplify the biomass/biofuel produced
  - Improves the net energy recovery from wet wastes
  - Destruction of bio-active compounds
- Next steps
  - Upscaling hydrothermal liquefaction systems
  - Reducing the retention time of algal wastewater treatment systems

* ER not include HTL process energy, which takes 5-10% of the biocrude energy				

# Synergy with Food & Biochemicals

*High Value Algae Co-Products Can Improve Economics and Provide Bridge Markets*

- ⊙ Animal Feed Supplements
  - ⊙ Omega-3 Fatty Acids (FA)
- ⊙ Dietary Supplements
  - ⊙ Amino Acids
  - ⊙ Poly Unsaturated FA- EPA, DHA
- ⊙ Fertilizers
- ⊙ Ethanol
  - ⊙ Direct starch processing
  - ⊙ Algae residues

# Why Algae?

- Algae improves wastewater nutrient removal
- Changes wastewater from CO<sub>2</sub> producing to CO<sub>2</sub> consuming
- High value extracted algal biochemical products
- Highly nutritious animal feed products
  - Better weight control, healthier skin and a lustrous coat (Pulz and Gross 2004)
  - Algae can increase Omega 3/6 PUFA in meat and egg products
  - Improved the color of the skin, shanks and egg yolks of poultry

# How would you define waste? ...

## Provide examples for your definition

- ① Material that is not wanted; the unusable remains or byproducts of something
- ① Something we have too much of to use effectively in a given area
- ① A resource that we have not yet figured out how to use- Buckminster Fuller

# CONTEXT: Breakdown of Current Energy Use Including Renewables

Note: Sum of components may not equal 100% due to independent rounding.  
Source: U.S. Energy Information Administration, *Monthly Energy Review*, Table 1.3 and 10.1 (April 2013), preliminary 2012 data.

# Why is energy policy so important?

*Energy use is correlated with prosperity*

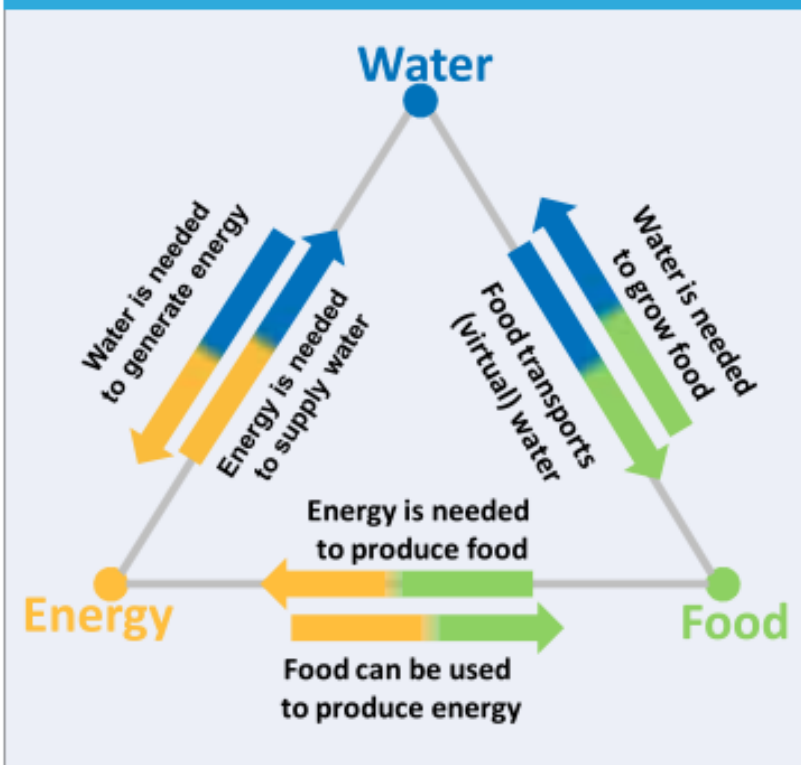

# Why is energy policy so important?

## *Energy security affects national security*

# Energy is coupled with... Water–Energy–Food

THE WATER-ENERGY-FOOD NEXUS (UNU, 2013)

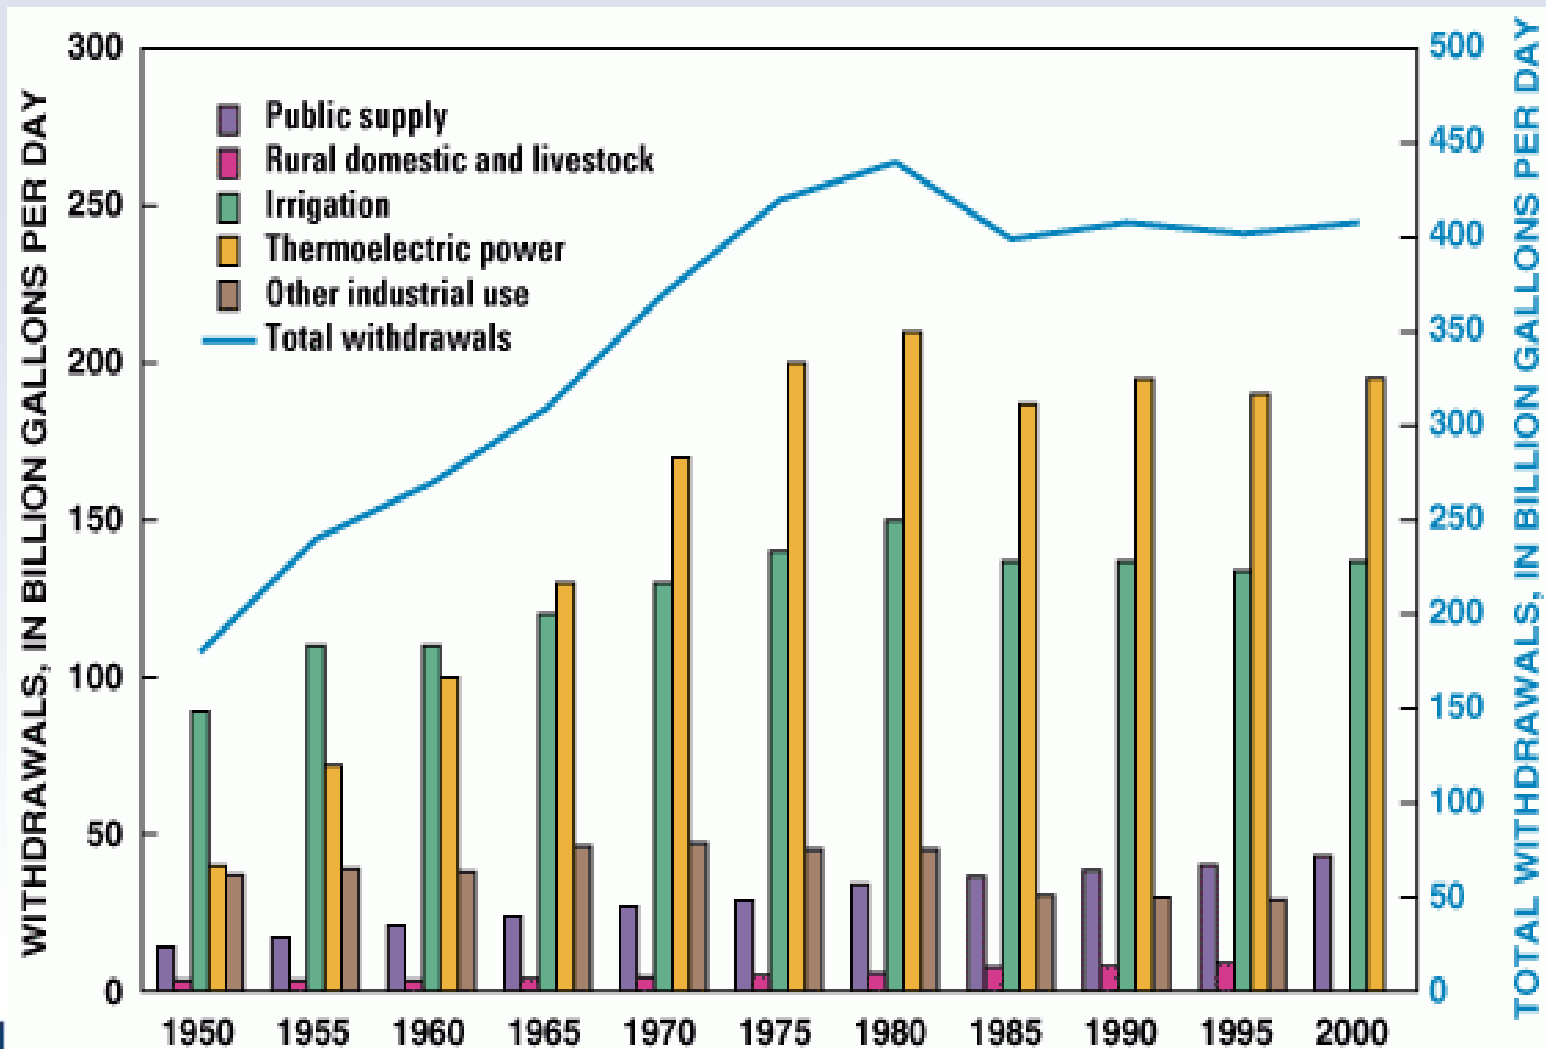

As population & prosperity increases, need more food, water, and energy

- More food → more water & energy
  - Water & energy for new arable land is higher
- More energy → more water & agricultural products (biofuels)
  - Water needs for remaining fossil fuels is higher
- More water (or higher quality) → more energy
  - Energy for advanced treatment is higher

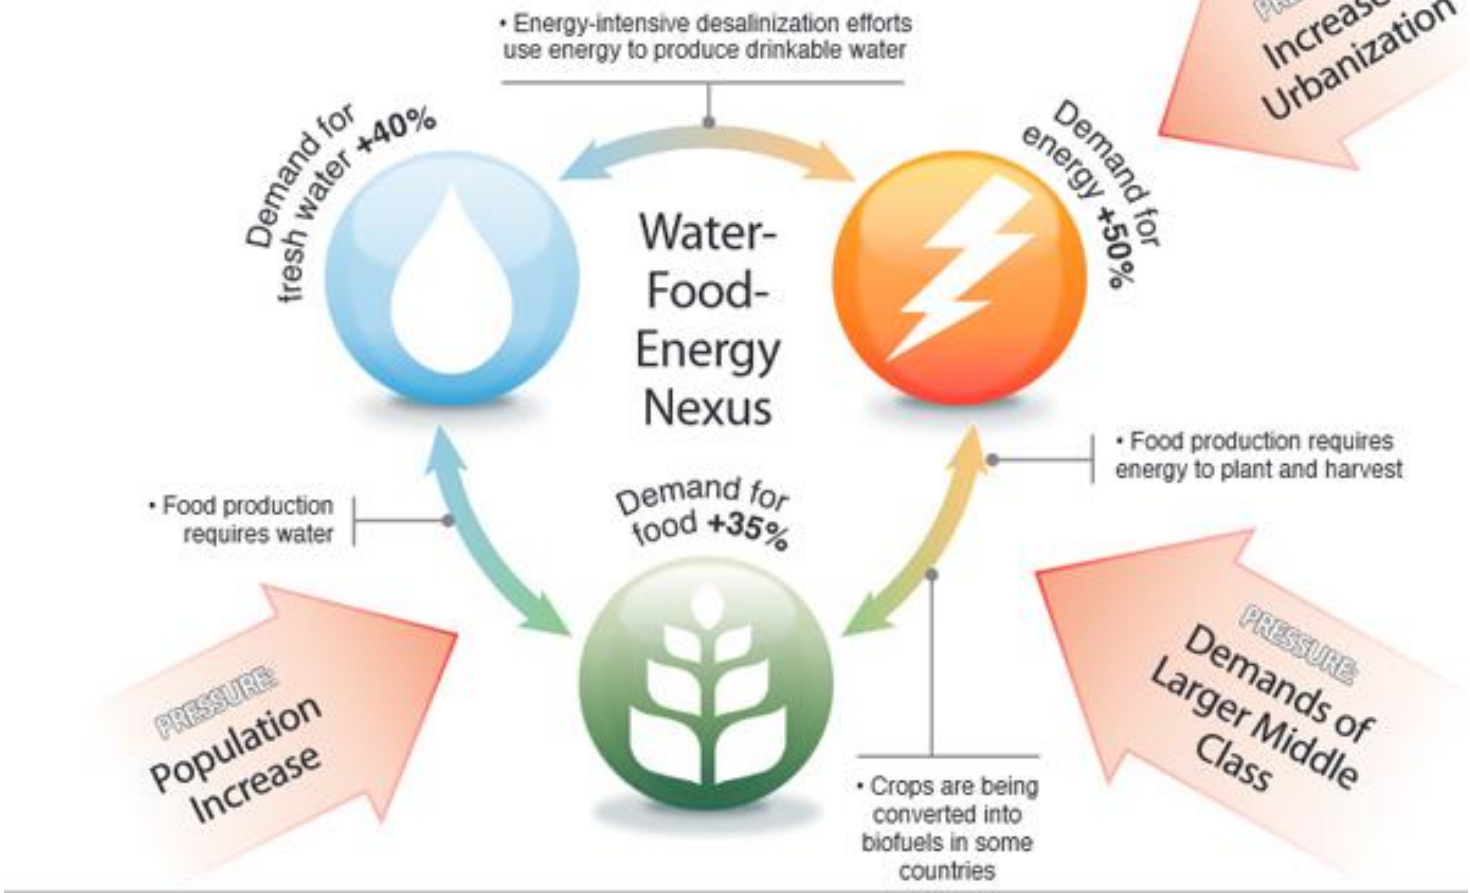

# Largest Water Uses for Energy & Agric.

# 20 yr Projected Increases Food, Energy & Water Demands

Because of growth in global population and the consumption patterns of an expanding middle class, in less than two decades three key demands will sharply increase ...

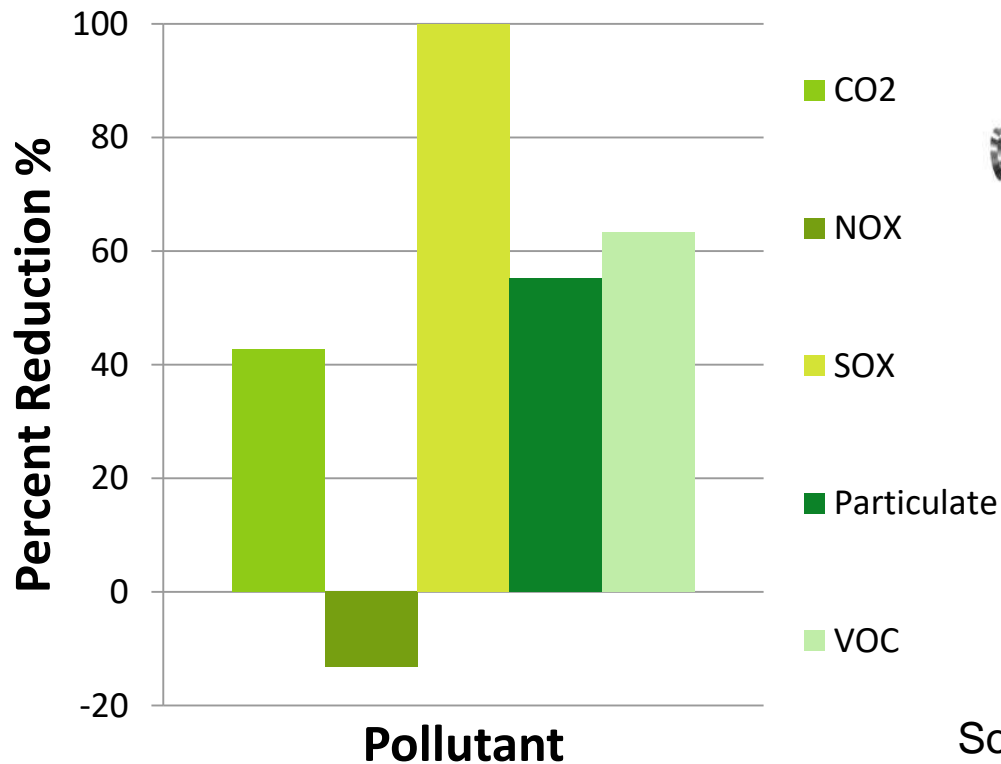

[www.cna.org/reports/accelerating-risks](http://www.cna.org/reports/accelerating-risks)

Improved technologies & coordinated management needed to avoid severe resource limitations & price increases

# Why Pursue Biofuels?

## *Reduce undesirable emissions*

- ⊙ GHGs reduced & potential to be carbon neutral/negative
- ⊙ Reduced exhaust emissions using biodiesel

Source: Demirbas, 2009

# Current energy use with fossil fuels increases atmospheric CO<sub>2</sub> & projected temperatures

# Pop quiz on current US biofuels...

- ⊙ What are the major types of US biofuels?
- ⊙ Feedstock sufficiency and competition for land
  - ⊙ What percentage of current grain goes to ethanol?
  - ⊙ What percentage is required for sustainable and secure energy security?
- ⊙ Fossil Fuel Inputs
  - ⊙ What is the net energy yield of grain ethanol ( $E_{out}:E_{in}$ )?

# BIOFUELS EVOLUTION & ISSUES

- **First Generation Biofuels (corn ethanol, soy biodiesel, etc.)**
  - **Food vs. fuel: 25-40% of corn diverted ethanol production**
  - **Insufficient feedstock: Currently, 2%-4% of petroleum demands**
  - **Greenhouse gas benefits reduced: Agrichemicals & land use changes**
  - **Significant water inputs for production and processing**
  - **Commercially viable without subsidy**

# SECOND GENERATION BIOFUELS (CELLULOSIC ETHANOL)

- **Improved feedstock sufficiency:  
>1 billion tons of US agric. biomass vs.  
1.2 billion tons of US oil demand annually**
- **Reduced food vs. fuel concerns for ag.  
residuals but not for energy crops**
- **Water inputs will likely increase**
- **Harvesting biomass could degrade soil**
- **Some commercial plants being built with  
government support and subsidies**

# FOOD VS FUEL DISCUSSION

- **Is it a good for biofuel feedstocks to also be useful for food?**
  - “Food vs. Fuel” was a noted concern for corn ethanol with 40% of corn used
  - What is the underlying problem?
  - What was different when we started building corn ethanol plants?
  - Do energy crops resolve this problem?
  - Does algae have the same problem?

# Current Algae Markets: High-value algal biomass

<b>Spirulina sp.</b>	<b>3000 tons</b>	<b>China, India, US, Myanmar, Japan</b>	<b>Human/animal nutrition, cosmetics, phycobilin pigments</b>
<b>Chlorella sp.</b>	<b>2000 tons</b>	<b>Taiwan, Germany, Japan</b>	<b>Human nutrition, aquaculture, cosmetics</b>
<b>Dunaliella salina</b>	<b>1200 tons</b>	<b>Australia, Israel, US, China</b>	<b>Human nutrition, cosmetics, b-carotene</b>
<b>Haematococcus pluvialis</b>	<b>300 tons</b>	<b>US, India, Israel</b>	<b>Aquaculture, astaxanthin</b>
<b>Cryptocodinium cohnii</b>	<b>240 tons</b>	<b>US</b>	<b>DHA oil</b>

**Total = ~7000 t DW/yr, Value = \$1-2 billion /yr**

# Algal BioChemicals for Cosmetics & BioMedical Applications

- ◎ For anti-aging cream, regenerating care products, emollient, anti-irritant in peelers, sun protection and hair care products
- ◎ Spolaore et al. (2006) showed that algae can
  - ◎ Repairs signs of early skin aging,
  - ◎ Exerts skin-tightening effect
  - ◎ Prevents stria formation
  - ◎ Stimulates collagen synthesis in skin

# Larger Markets-Animal Feed

<http://www.allaboutfeed.net/>

Table 1 – Global feed tonnage by species and region. (Millions of tons)

Country	Poultry	Ruminant	Pig	Aqua	Other <sup>3</sup>	Total
Asia	116.00	80.12	81.00	24.50	4.03	305
Europe <sup>1</sup>	67.96	55.76	61.90	1.72	7.80	200
N. America <sup>2</sup>	91.07	45.50	31.23	0.28	17.09	185
Middle East/Africa	27.71	17.04	0.87	0.60	0.72	125
Latin America	71.26	22.34	24.80	1.88	4.46	47
Others	4.60	3.49	2.00	0.20	0.86	11
<b>Total</b>	<b>378.60</b>	<b>224.25</b>	<b>201.80</b>	<b>29.18</b>	<b>34.96</b>	<b>873</b>

- © Feed values range from \$100/ton (DDGS) to \$2,000/ton (Fishmeal)
- © Total Market Value ~\$300 Billion

# Advantages of algae as an animal feed

- ⊙ Increasing market demand for Omega 3/6 PUFA enriched meat & egg products
- ⊙ Many other benefits (e.g, Pulz & Gross, 2004)
  - ⊙ Better weight control
  - ⊙ Healthier skin and lustrous coat
  - ⊙ Lower breakdown of unsaturated fatty acids
  - ⊙ Improved color of shanks and eggs

# Algal biofuels can synergize with wastewater treatment

- ◎ 100% US diesel demand via algae would use 0.3 - 40 Billion gpd
  - ◎ US fresh water withdrawal = 346 Bgpd
  - ◎ US municipal wastewater = 40 Bgpd
- ◎ Algal wastewater treatment provides superior nutrient removal to avoid downstream water quality problems
- ◎ National Algal Biofuels Technology Roadmap (DOE, 2010)
  - ◎ “Inevitably, wastewater treatment and recycling must be incorporated with algae biofuel production...”

# Impacts of Residual Nutrients

- ◎ N and P removal at WWTPs is costly: \$8,130 and \$49,500 per ton (*Hey et al., 2006*)
- ◎ Environmental algae grow on residual nutrients and cause problems
  - ◎ Algal toxins
  - ◎ Hypoxia
- ◎ Could harvest environmental algae for biofuels
  - ◎ Need new harvesting equipment and precision agricultural techniques

# EVALUATION OF ALGAE-BASED WASTEWATER (WW) TREATMENT

## Algal-bacterial symbiosis

- “Photosynthetic Aeration” reduces energy input
- High nutrient and organic removal is possible
- New biomass “resources”

(National Algal Biofuels  
Technology Roadmap, 2010)

## Why don't we use more algal WW systems?

- Currently no use for extra biomass
- Removal is dependent on light, temperature, etc.
- Clean Water Act funded activated sludge
- Energy was considered plentiful and cheap

# Synergy of Algal Biofuels and Wastewater Treatment

National Algal Biofuels Technology Roadmap:  
(DOE, 2010, pg. 83)

“Inevitably, wastewater treatment and recycling must be incorporated with algae biofuel production.”

*However...*

“Nutrient recycling would be needed since wastewater flows in the United States are insufficient to support large-scale algae production on the basis of a single use of nutrients.”

*How can we accomplish this vision?...*

# Understanding water needs for algal cultivation

- ❑ Lesson- Using wastewater reduces input costs and environmental impacts, but favors low-oil biomass. (Also, not enough waste nutrients if used only once.)

# Problems with early algal biofuel paradigms

- Most current algal biofuels approaches focus on high-oil algae

## □ Problems

- Energy balance
- Contamination at large-scale with low-oil species
- Cost and/or environmental impact of inputs
  - Water, Nutrients, CO<sub>2</sub>

# Problem: Energy Balance

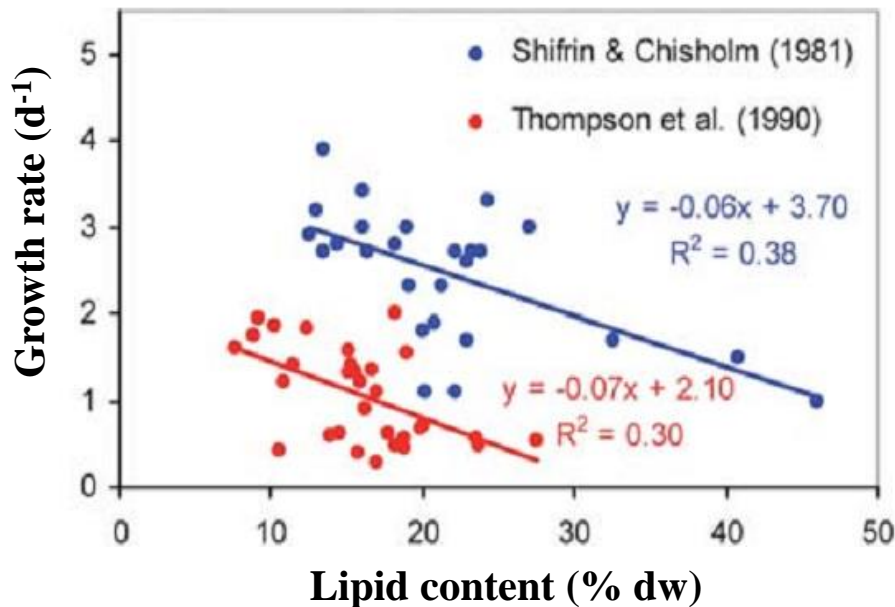

□ Most energy spent on drying, extraction & harvesting

□ Lesson: Must process wet (dewatered) biomass

# Problem: Contamination of Target Species (High-Oil Algae)

## □ Fat Algae vs. Fast Algae

(Williams & Laurens, 2010)

(adapted from Rodolfi et al., 2009)

- Lesson: Biofuel processes that utilize low-oil biomass are highly advantageous
  - Natural selection becomes an ally

# Past Algal Biofuels Economic Analysis

Source	Productivity (mt/ha/yr)	Lipids %	Capital cost (\$/ha)	Operation cost (\$/ha)	Algae oil (\$/bbl)	Algal oil (\$/gal)
Benemann et al., (1982)	67.5	40	\$88,519	\$41,085	\$225	\$6.09
Weismann and Goebel (1987)	112	30	\$139,784	\$58,744	\$241	\$5.75
Benemann and Oswald (1996)	109.5	40	\$108,889	\$38,577	\$101	\$2.41
Average values	96.3	36.7	\$112,397	\$46,135	\$199	\$4.75

(Gallagher , 2011)

# Algal biofuels can be cost-effective when combined with waste treatment

Algae Treatment Case (100 ha)	Operation expenses	Capital charge	Electricity production credit	Biofuel production (bbl/yr)	Cost of fuel (w/o wastewater treatment credit)	Cost of fuel (w/ wastewater treatment credit)
Wastewater Treatment with Biofuel Production	\$2,960,000	\$3,170,000	\$831,000	12,700	\$417/bbl	\$28/bbl
Biofuel Production Only	\$2,810,000	\$2,720,000	\$554,000	12,300	\$405/bbl	\$332/bbl

A Realistic Technology and Engineering Assessment of Algae Biofuel Production. (Lundquist et al., 2010)

# Environment-Enhancing Energy-

A new approach that synergistically combines algal wastewater treatment with hydrothermal liquefaction to resolve all 3 major problems with current algal biofuel paradigms, and introduces...

**Multi-cycle Nutrient Reuse, which leverages waste nutrients to maximize biofuel production**

# Component A- Algal wastewater treatment systems have been scaled-up...

**Algal Turf Scrubber** (Mulbry et al., 2008; Hydromentia )

**algaewheel.**  
CLEAN WATER • CLEAN AIR • CLEAN ENERGY

(Biotown- Reynolds, IN, 2010)

**These systems produce low-oil, mixed algal biomass**

# Component B- Hydrothermal liquefaction (HTL) converts wet, low-lipid biomass into crude oil

**E<sub>out</sub> : E<sub>in</sub> > 3:1 at lab-scale (% solids = 20%)**

**E<sub>out</sub> : E<sub>in</sub> > 10:1 w/ heat exchangers as projected by commercial partners**

Source: Hunt, John. 1979.

Petroleum Geochemistry and Geology

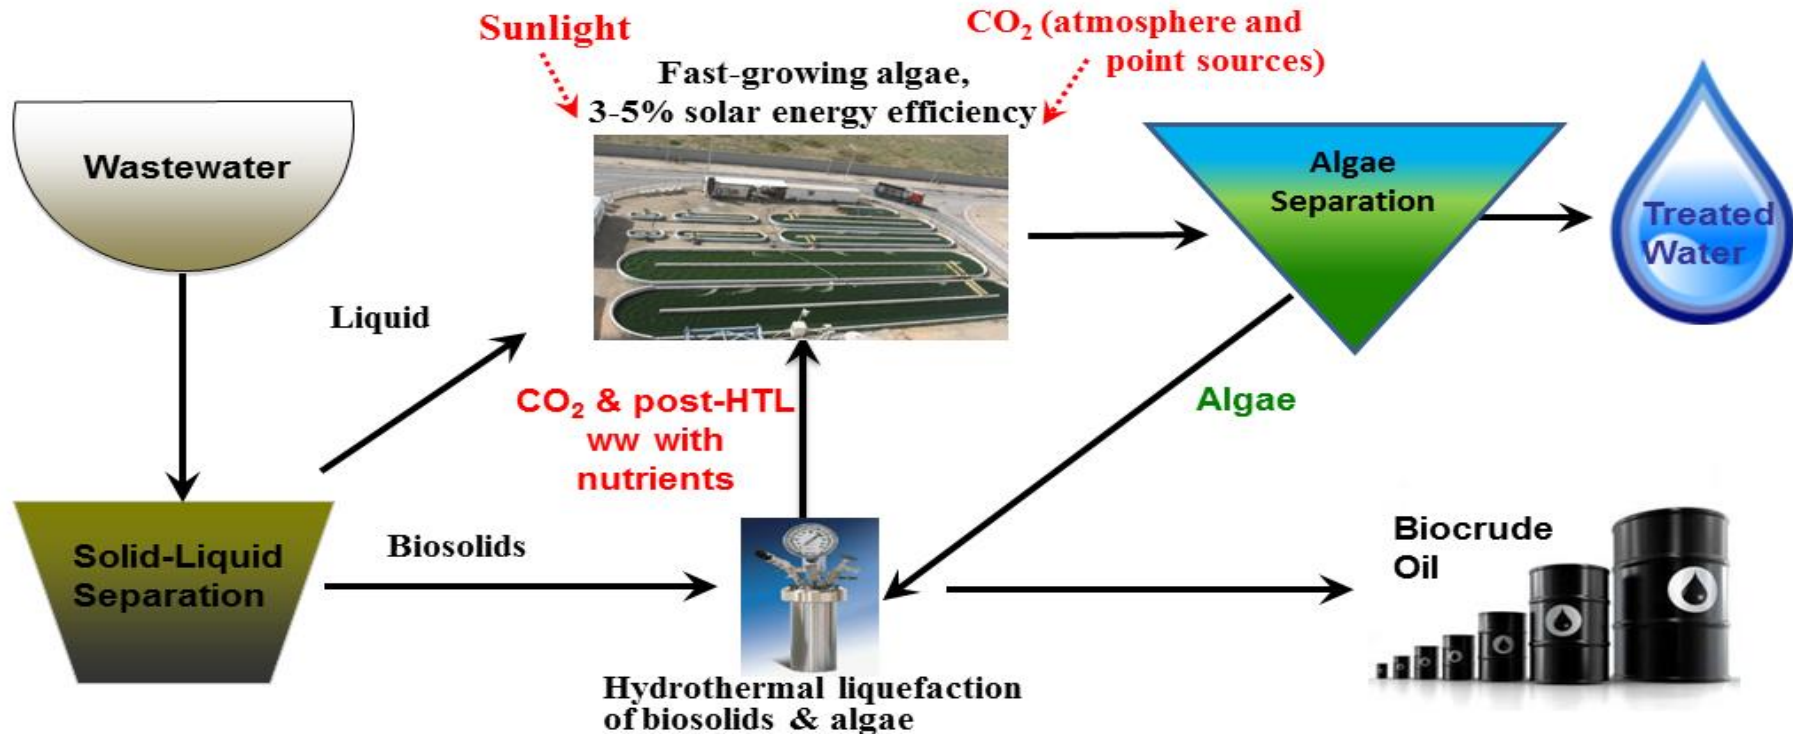

# Upscaling E2-Energy System- HTL Equipment

## *10-20 ton/day Demonstration HTL System on South Farms*

# 4 steps of E<sup>2</sup>-Energy confirmed at bench scale

1. Algae can be *grown* in raw ww and **post-liquefaction ww**.
2. Organics and nutrients can be **removed** from ww and **recovered** during algal biomass production.
3. Algal biomass in ww can be converted into **biocrude oil** via hydrothermal liquefaction.
4. Nutrients can be **recycled** within this system to maximize the biomass and bioenergy production from wastes.

# Step 4. Can HTL re-release nutrients captured in algal biomass for multiple cycles of algal growth?

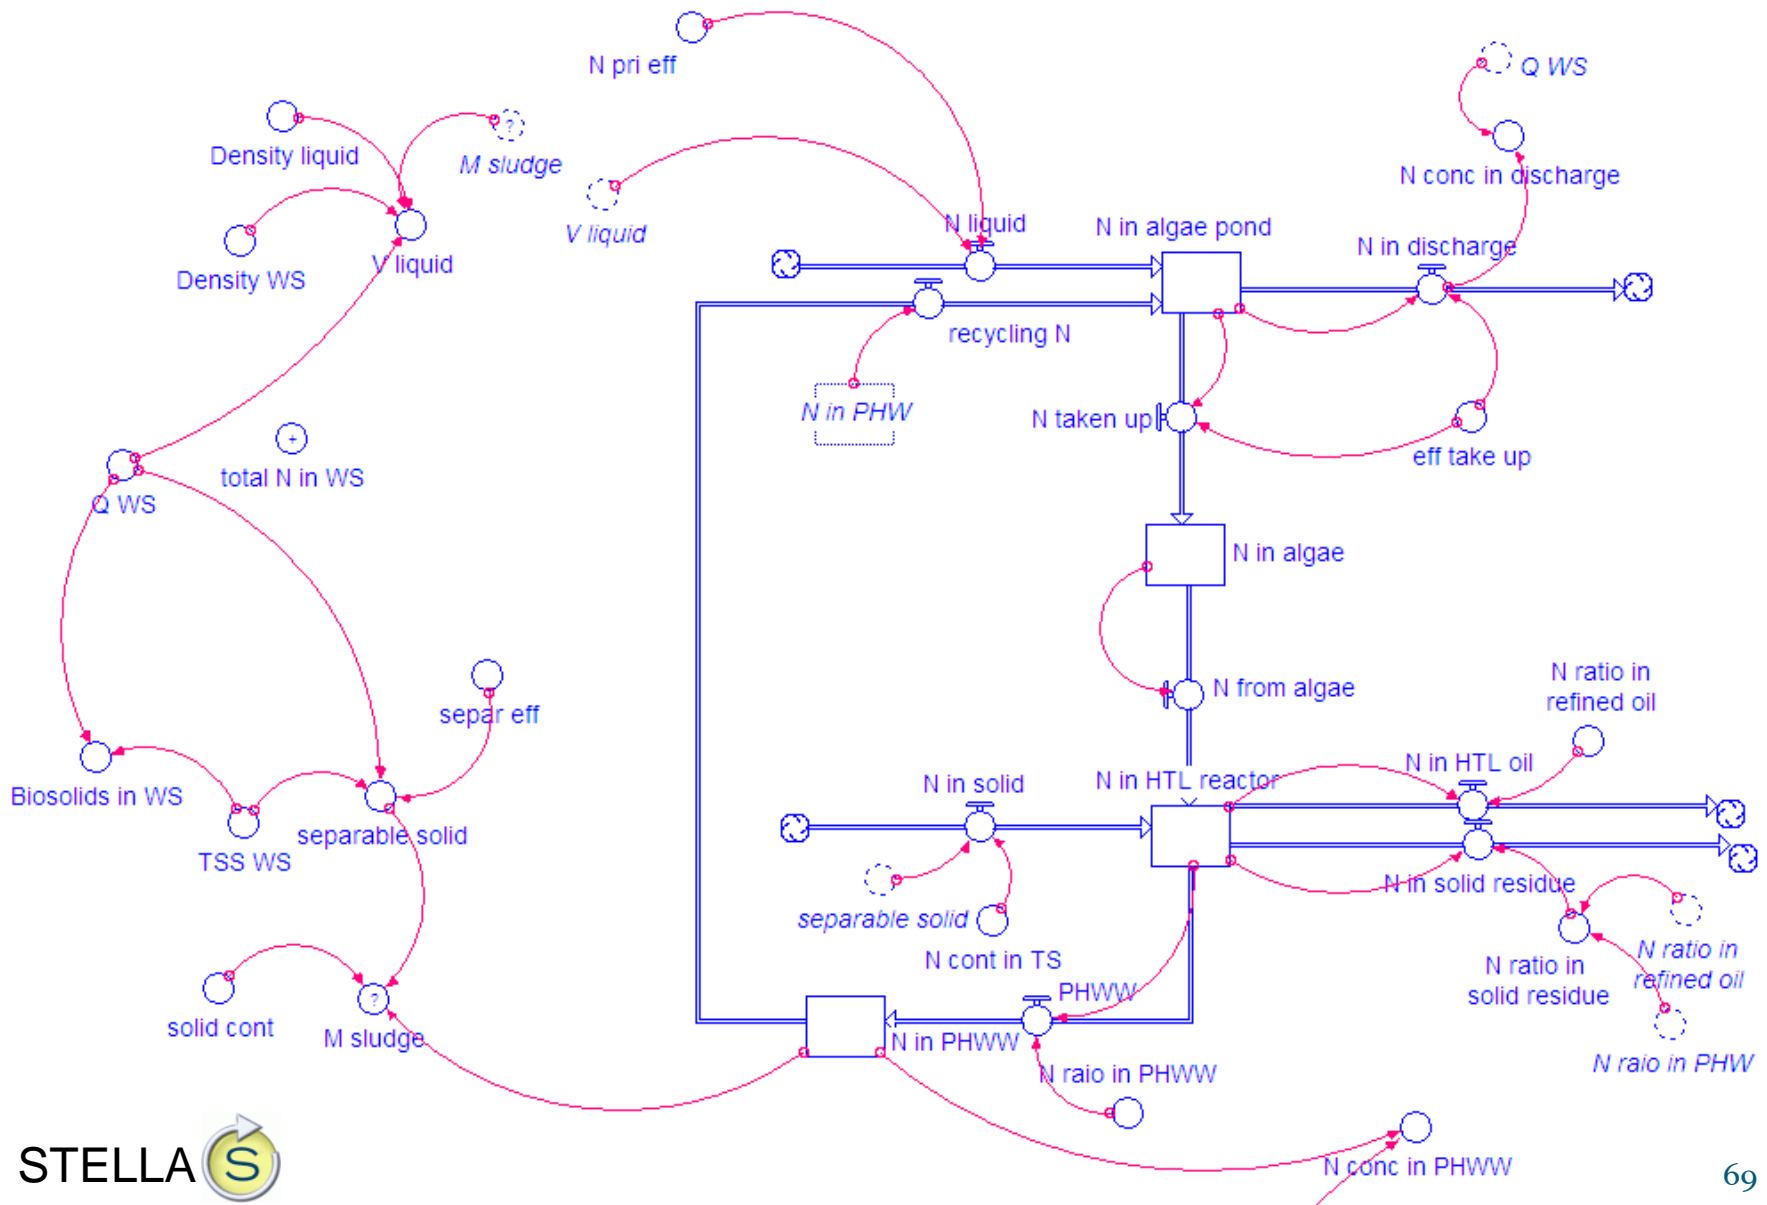

## □ N distribution

- ✓ 45-75% N in post-HTL ww
- ✓ N distribution can be manipulated with HTL conditions

(Yu et. al, 2011)

# E<sup>2</sup>- Energy System Modeling with Stella Software

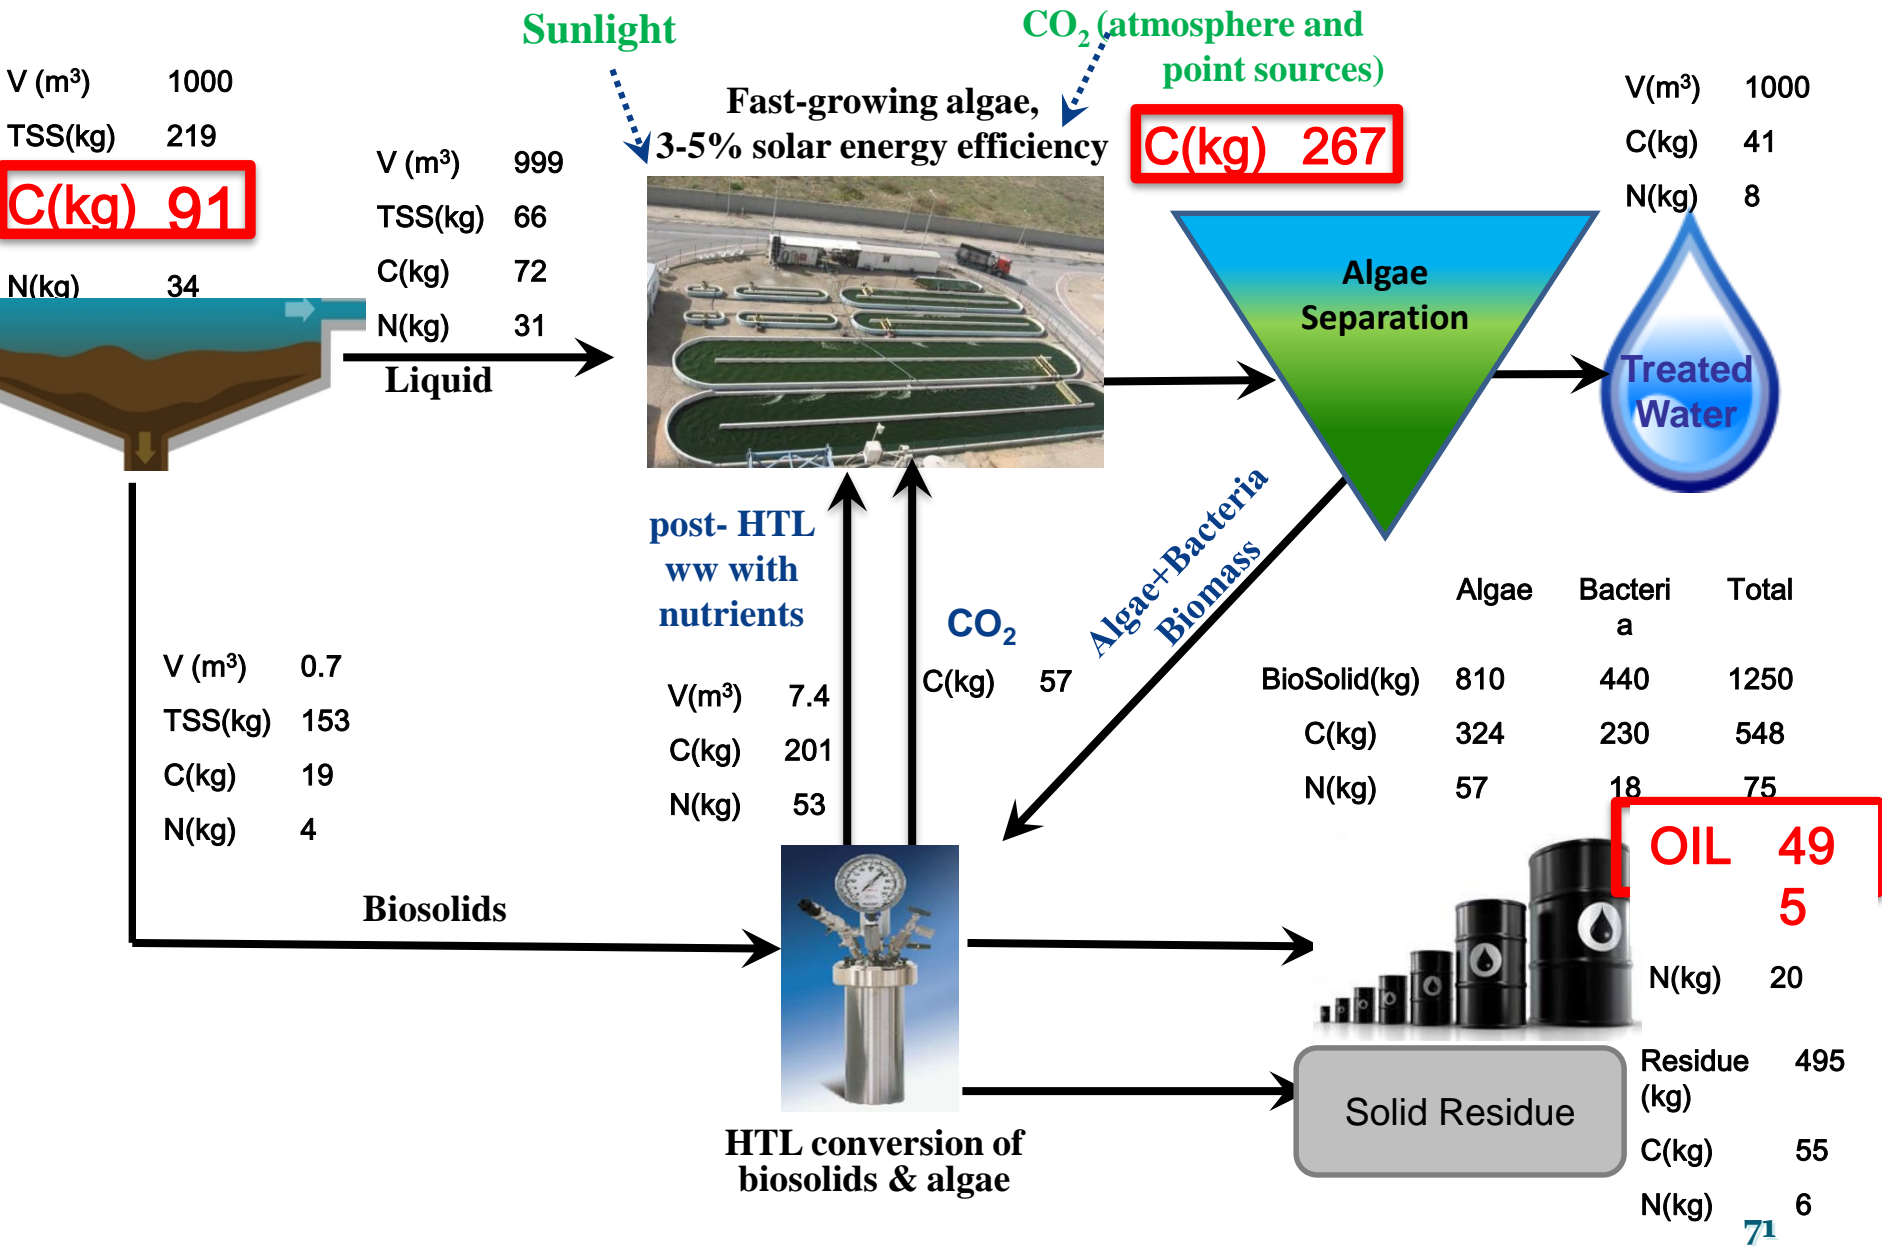

# System Modeling of Biomass Multiplication Ratio

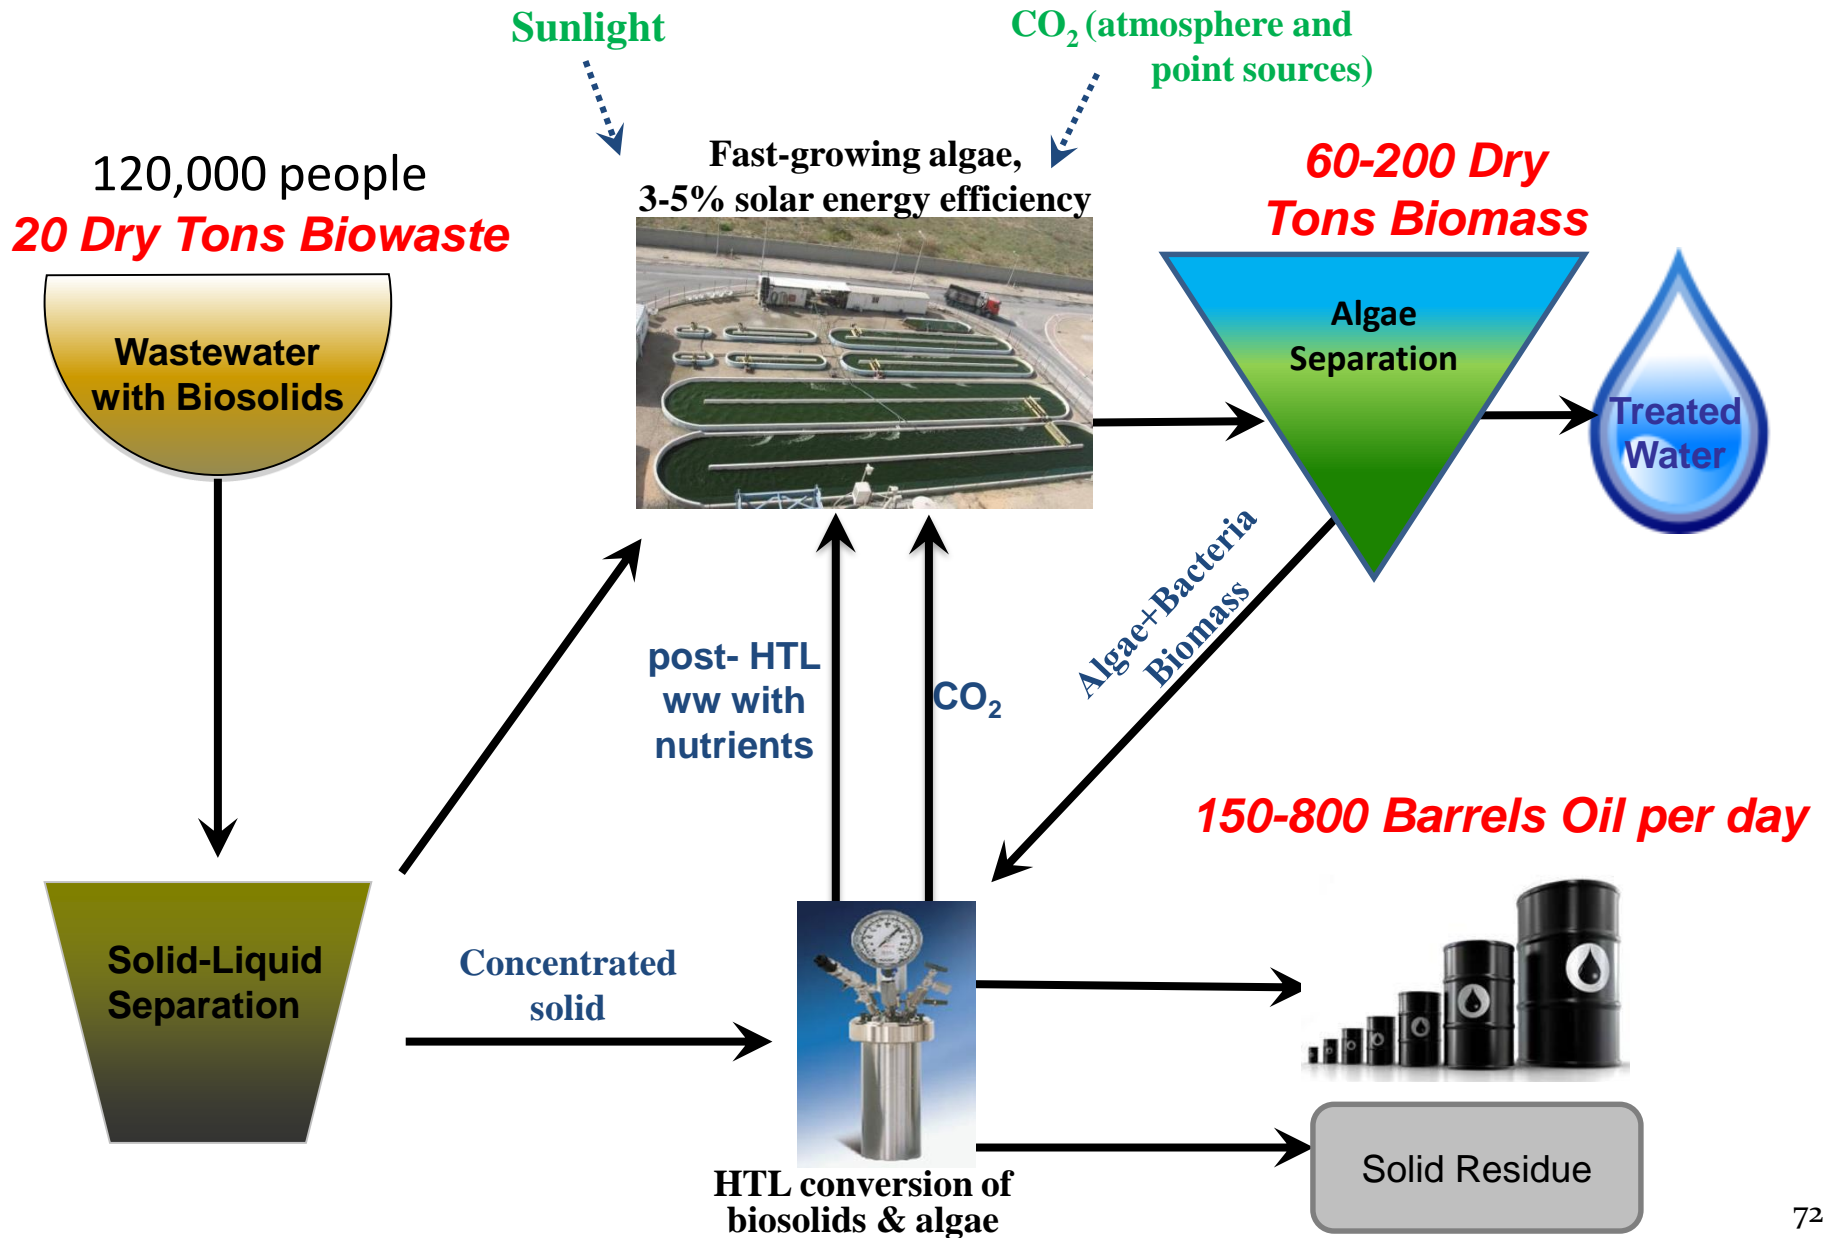

- **Biomass multiplication = 3.4 to 10.4 times original ww VS**

# Example Model Output: C, N and Mass (Water) Flows

# E<sup>2</sup>-Energy Example for Champaign-Urbana

# Now Let's Think Big...

**US collects and processes 200 million dry tons of biosolids per year...**

200 million tons  
of organic  
biowastes

0.6 to 2 billion  
tons of algae  
biomass

0.3 to 1.2 billion  
tons of biocrude  
oil

***US oil consumption is ~1.1 billion tons/yr !!!***

# Next Steps: E<sup>2</sup>-Energy Demonstration Facility

- ❑ Many partners supporting development of an E<sup>2</sup>-Energy research and education facility at the UIUC swine farms,
  - Phase 1- gal/day, Phase 2- bbl/day (current), Ph 3- Deploy
- ❑ Need additional partners- Waste producers, Capital Supply, Refined product users, Continued R&D

# ANY QUESTIONS?

- ◎ Lance Schideman [schidema@illinois.edu](mailto:schidema@illinois.edu)
- ◎ Illini Algae Club <http://algae.illinois.edu>

# How would you define waste? ...

## Provide examples for your definition

- ① Material that is not wanted; the unusable remains or byproducts of something
- ① Something we have too much of to use effectively in a given area
- ① A resource that we have not yet figured out how to use- Buckminster Fuller

# Another algal biofuels opportunity...

## Harvesting Algae from hypoxic zones

# CASE STUDY: GULF OF MEXICO HYPOXIA

## - Synergy with environmental clean-up

Hypoxia =  
Dissolved O<sub>2</sub>  
< 2ppm

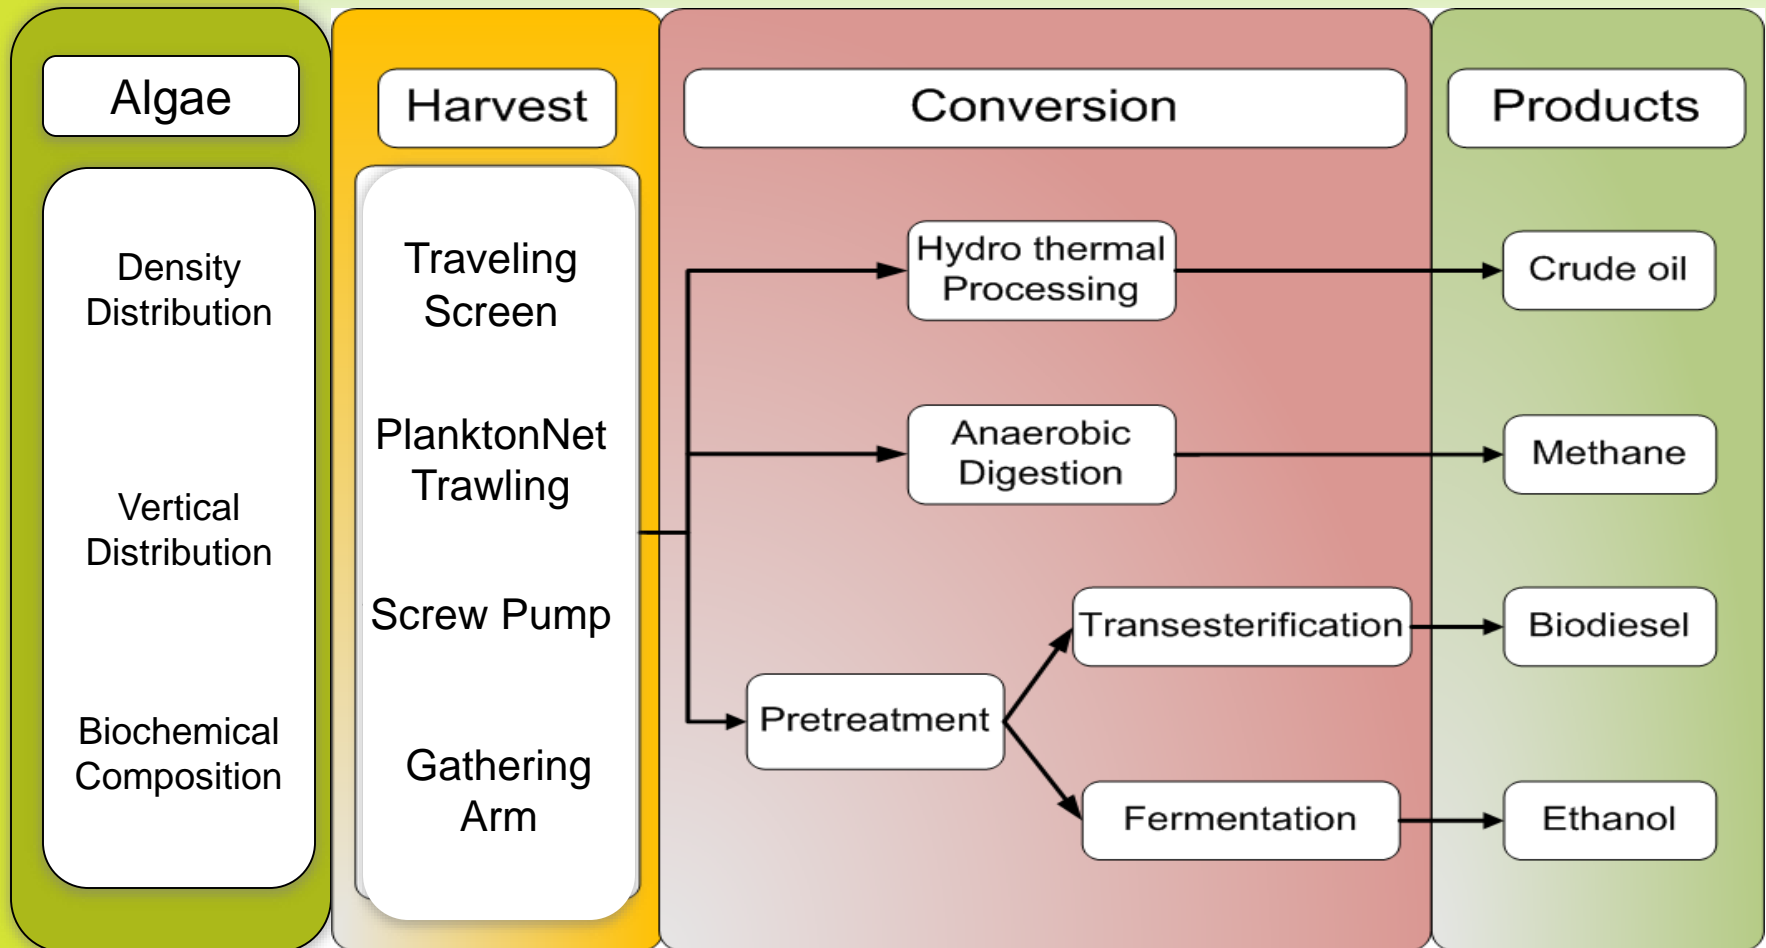

Hypoxia  
occurs after  
algal blooms

Hypoxic zone  
size is 2000 -  
8000 mi<sup>2</sup>

EPA goal is  
2000 mi<sup>2</sup> by  
2015  
(5000 km<sup>2</sup>)

Crude Oil

# GULF OF MEXICO SATELLITE CHLOROPHYLL IMAGERY

- ① Seastar Satellite launched with a Sea Viewing Wide Field-of-View Sensor (sea-WiFS)
- ① Detect the reflection of sun light during an algae bloom
- ① Chlorophyll absorbs red and blue light and reflects green light (500-600nm).
- ① Convert radiance values to in-situ measurements of chlorophyll density

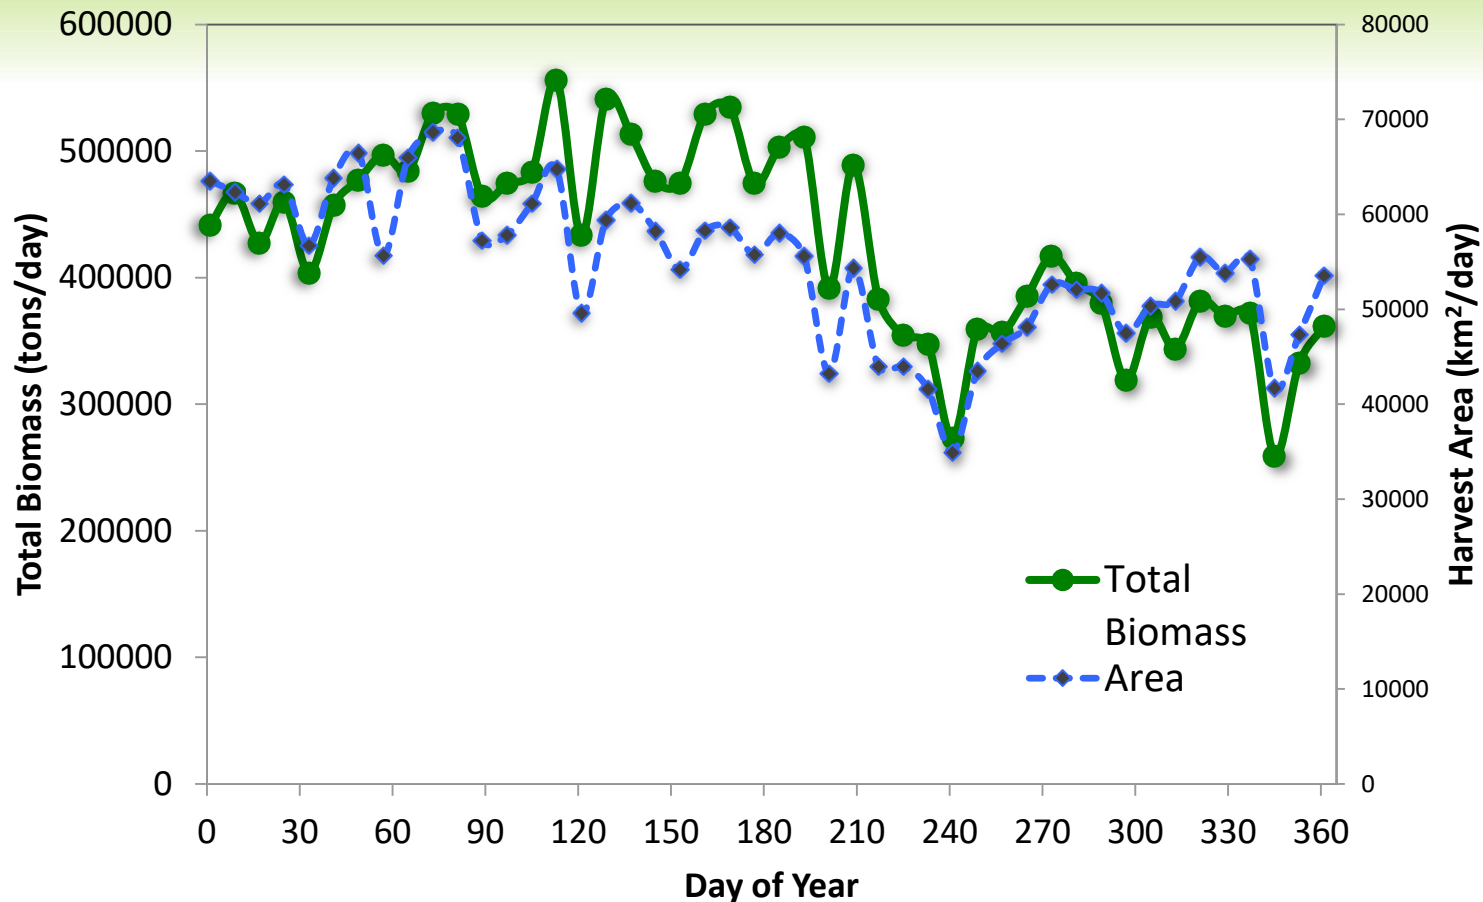

# HIGHLY EUTROPHIC SURFACE AREA BIOMASS ESTIMATED USING SATELITE IMAGARY

Highly eutrophic area: (chlorophyll a > 67 mg/m<sup>3</sup>)  
Surface = 0 - 0.5 m depth

# CASE STUDY: GULF OF MEXICO

## HIGHLY EUTROPHIC AREA TOTAL ALGAL BIOMASS

Highly eutrophic area: (chlorophyll a > 67 mg/m<sup>3</sup>)

# ENERGY “BREAK-EVEN” POINT AND ENERGY CONSUMPTION RATIO

# VERTICAL FLOTATION INTEGRATED HARVESTING

Lab tests showed 72% of total biomass can be collected at surface with flotation

# ECONOMIC ANALYSIS

	Remove Algal Bloom Chl <sub>sat</sub> >50	Energy Production Chl <sub>sat</sub> >67	Harvest with Vertical Focusing Technology Chl <sub>total</sub> >67
Number of Vessel Required	32	9	2278
Annual Bloom Area (km <sup>2</sup> )	6,669	3,382	2,517,835
Annual Biomass (ton)	27,781	17,666	19,780,685
Annual Net Biofuel Production (barrel)	4,597	6,430	12,377,143
Annual Biofuel Income (\$)	413,730	578,700	1,113,942,870
Annual Labor Cost (\$)	1,333,800	676,400	503,567,000
Equipment Cost (\$)	7,360,000	2,070,000	523,900,000
Total Cost (\$)	8,693,800	2,746,400	1,027,467,000
Annual Net Income (\$)	<b>(8,280,070)</b>	<b>(2,167,700)</b>	86,475,870

# Conclusions

## *WILL ALGAE BE A FUEL OF THE FUTURE?*

- Algal biofuels have significant promise
  - Higher productivity, non arable lands, etc.
- Current limitations
  - Contamination, high harvesting energy, nutrient costs
- Natural algal bloom harvesting has potential
  - Plankton nets with hydrothermal liquefaction was best
  - Harvesting Gulf algae and converting it to biofuels can produce **12 million barrels** and a **net profit of \$86 M**
  - Resolves a significant environmental problem
- E2-Energy maximizes biofuel production from wastewater via multi-cycle nutrient reuse
  - Can potentially provide up to 1.2 billion tons /yr of oil

# NEXT STEPS

## Harvesting Natural Algal Blooms

- ③ Develop new algal bloom harvesting equipment
  - ③ Ship mounted add-on
  - ③ Dissolved air flotation
- ③ Foreign applications with more severe algal bloom problems
- ③ Intelligent (precision) harvesting system
  - ③ Integrate meteorological data and satellite imagery to plan optimum harvesting route

# ILLINI ALGAE CLUB- EDUCATION, OUTREACH & TOURS

- ◎ Online interactive website at [Algae.Illinois.edu](http://Algae.Illinois.edu)

# Campus Sustainability Project Algal Biofuels for Carbon Capture

- ⊙ Abbott Power Plant - coal and natural gas
- ⊙ Located on campus next to Memorial Stadium

# ABBOTT FY08 CO<sub>2</sub> EMISSIONS

- ◎ Campus CO<sub>2</sub> emissions - **505,272 tons**
- ◎ Abbott gas emissions (40%) - **203,464 tons**
- ◎ Abbott coal emissions (33%) – **167,293 tons**
- ◎ *Average power plant produces 1.2 million tons CO<sub>2</sub> annually*
- ◎ Assuming 2kg of CO<sub>2</sub> per 1kg of algae & 20% oil
- ◎ Potential for **245 million gallons** of oil annually

*Emission data obtained from  
[www.energymanagement.uiuc.edu](http://www.energymanagement.uiuc.edu)*

THANK YOU FOR YOUR TIME...

ANY QUESTIONS?

- ◎ Lance Schideman [schidema@illinois.edu](mailto:schidema@illinois.edu)
- ◎ Illini Algae Club <http://algae.illinois.edu>

# Why Algal Biofuels?

## *Less competition for arable land use*

- ⊙ Algae require less land and can use marginal lands and waterbodies not suitable for agriculture
  - ⊙ Reduced “Food vs. Fuel” concerns
- ⊙ Creation of new arable land incurs a debt for greenhouse gases (GHGs) (Fargione et al., 2008)
  - ⊙ Soy biodiesel: 37 – 319 years
  - ⊙ Corn ethanol: 48 – 93 years
  - ⊙ “biofuels made from waste biomass ... incur little or no carbon debt and can offer immediate and sustained GHG advantages.”

**VS.**
